- Appendix B Developing a Study Methodology: A Formula for Identifying and Assessing Sharing Opportunities in Other Markets

Executive Summary

EXECUTIVE SUMMARY

Study Mandate and Objectives

Sharing and collaboration, at some level, have been ongoing between the Department of Defense (DoD) and the Department of Veterans Affairs (VA) health care systems for several decades. In the past five years, however, there has been increased emphasis on expanding the scope and extent of sharing and collaborative efforts between DoD and VA. Recent Congressional direction reflects this increased interest. Section 8147 of the FY02 Defense Appropriations Act mandates that the Secretaries of Defense and Veterans Affairs jointly conduct a comprehensive assessment to identify and evaluate changes to DoD and VA health care delivery policies, methods, practices and procedures, in order to provide improved health care services at reduced costs to the taxpayer.

The DoD/VA Health Executive Council, through the Joint Facility Work Group, was charged with overseeing this comprehensive assessment as part of its responsibility to address the need for collaboration between the two Departments. The Office of Special Programs, TRICARE Management Activity (TMA) contracted with Mitretek Systems, Inc. (Mitretek) to conduct the DoD/VA Joint Assessment Study (JAS).

The primary Study objective was to explore the sharing options that exist between DoD and the VA, and identify the most promising sharing opportunities to pursue, based upon their demonstrated potential to improve access to and the quality of the health care services provided, and to reduce costs to the taxpayer in the future. The Study focused on examining collaboration and sharing opportunities—and potential implementation actions—for three specific DoD/VA Market Areas: Puget Sound, Gulf Coast, and Hawaii.

The second objective of the Study was to develop a data repository and an analytical methodology that could be repeated at other sites or on a national scale. Thus the Study also included significant effort aimed at the development and subsequent assessment of the value of such a methodology.

Study Accomplishments

The subject of DoD/VA collaboration has been studied extensively over the past 20 years. It is a complex and difficult subject, requiring a thorough understanding of the health care requirements of the beneficiary population within a local market. The Joint Assessment Study was designed to complete a market-based evaluation of potential sharing opportunities using analytical methods. Major accomplishments of the Study include the following.

1. **Mitretek created a “Combined Beneficiary perspective” for evaluating sharing opportunities.**

This Study adopted the perspective of a combined beneficiary population for a given market area in order to evaluate sharing opportunities in a holistic fashion rather than the potentially conflicting interests of the two delivery systems taken separately.

2. **Mitretek combined all the necessary planning data to comprehensively and systematically identify Market-wide opportunities.**

This approach provides the most complete picture of the nature of these beneficiaries' demand for health care services in a market and the total resources that these two Federal agencies are currently committing to meet these needs.

3. **Mitretek produced tools and methods that can be consistently applied to evaluate the merits of sharing opportunities.**

Tools and methods were created as part of the Study to measure both quantitative and qualitative factors important for assessing sharing opportunities.

4. **Mitretek met the Study objectives to measure the benefits of sharing opportunities on beneficiaries and the taxpayers.**

Meeting the primary Study objective itself was a significant accomplishment in the evolution of joint planning efforts between DoD and VA.

5. **Mitretek built a foundation for future Federal planning initiatives.**

The Study incorporates "lessons learned" from past and current sharing initiatives and builds upon those to provide a stronger foundation to support future efforts.

6. **Mitretek developed categories and lists of sharing opportunities common to all markets.**

The Study identifies nine domains of collaboration and three levels of effort required to address the most promising sharing opportunities.

7. **Mitretek recognized that integration can happen at many different levels within organizations to achieve desired results.**

This Study recognizes that full "integration" of services is not necessarily the best goal of DoD/VA sharing efforts; collaboration at lower levels within organizations in local markets may often provide the "best fit" between the needs of the populations and the specific clinical services available.

Approach to Conducting the Study

Mitretek designed and executed the Study around four major tasks, which are:

1. Conducting background research on DoD/VA sharing experiences;
2. Developing a standard, replicable methodology that includes two major components:
 - A standard data repository integrating relevant data from both DoD and VA sources and,
 - Analytic tools, methods and procedures using a common approach to address the primary Study question in detail;
3. Applying the methodology in three Study Market areas (Puget Sound, Gulf Coast, and Hawaii); and

4. Preparing a final report documenting the Study effort and its results.

Mitretek collected and reviewed relevant studies from DoD and VA related to current planning initiatives, such as the VA CARES process and the *President's Task Force to Improve Health Care Delivery for Our Nation's Veterans*. Mitretek also conducted field visits to three existing DoD/VA Joint Venture sites. These research activities informed the overall design and content orientation of the Joint Assessment Study methodology.

Mitretek developed two distinct frameworks as a part of this effort; one for measuring health care requirements and system capacity, and the other to frame the requirements for collaboration. This joint market planning approach and its underlying methodology can be readily adapted to the specific circumstances of other markets—that is, the methodology can be replicated.

The Study approach and methodology identified and assessed promising opportunities to achieve partial or full integration in areas where these efforts would have a favorable impact on access, cost or quality. The creation of a re-usable data repository and decision-support tools was an integral part of the approach developed in the Study.

Mitretek considered that the value and worth of any identified sharing opportunity would be judged by the extent to which it increased access, improved quality, or reduced costs—and potentially all of these. Identifying those sharing and collaboration opportunities that could improve access (as the starting point) required the creation of a comprehensive database, including information and data on:

- The demographics and origin of eligible and enrolled DoD and VA beneficiaries;
- Similar data for those beneficiaries using their respective health care delivery systems;
- The volume and characteristics of the services provided, including outpatient visits, inpatient discharges, bed-days of care, diagnoses, procedures, and locations of service, including direct and indirect care¹;
- The supply of resources—including staff and physical space—and the capacity of each facility to provide these services; and
- The costs of providing these services.

The assembled data supported the quantitative analyses performed to identify the most promising and desirable opportunities for increased sharing and collaboration through possible redistribution of care access points, providers, or locations where care can be most efficiently rendered to a Combined Beneficiary population. However, Mitretek determined that this result, while necessary, was insufficient to achieve the overall Study objectives; while *desirable*, these opportunities may not be completely *feasible* (recognizing that, in reality, there are two very large, mature, and well-entrenched health delivery systems already in place). The numerous mission, policy, infrastructure, and organizational culture issues that simultaneously distinguish and divide the health care delivery operations of the Departments of Defense and Veterans Affairs raise real and

¹ Indirect care is defined as purchased care by the DoD and fee-basis care by the VA.

practical challenges to implementing a large number of very important, promising, desirable sharing opportunities.

While both VA and DoD have patient care as a central focus of their health care delivery missions, each System approaches its respective tasks differently. Sharing opportunities, by definition, cut across the traditional boundaries between the Systems, and involve joint or combined execution of activities routinely accomplished by each System for its own purposes. These include clinical practices, electronic exchange of information, administrative practices, and the pursuit of educational and research agendas. Additionally, while both Systems have a national security component, it is a core concern for DoD, but only tangentially related to VA's day-to-day operations. Mediating the sometimes conflicting concerns of "readiness" and "health care" remains a challenge to any greater degree of collaboration and sharing between the two Systems.

Mitretek has approached the Study within this context: recognizing the thicket of these complex, real-world issues and concerns while simultaneously developing a quantitative methodology for highlighting potential sharing opportunities. This Study takes a holistic approach—both "calling it by the numbers" and respecting the many organizational barriers or enablers to collaboration.

While it appears true that "all health care is local," it is also desirable to plan for the delivery of health care services to Combined Beneficiaries from a comprehensive, data-driven, logically developed, analytic foundation, highlighting and respecting local issues and perspectives, but incorporating them systematically into a broader methodological context. Mitretek believes that the results documented in this report demonstrate that they have made significant progress in developing this analytic foundation through the Study methodology.

Results and Recommendations

When applied to the three Market areas, the Study methodology revealed the following examples of major potential sharing opportunities in each.

- Puget Sound Market – This example emphasizes access to primary care services, and uses the methodology to demonstrate how access performance can be improved significantly by opening new access points and redistributing capacity from facilities with excess capacity.
- Gulf Coast Market – This example focuses on inpatient services within a particular Submarket (Biloxi/Gulfport), using the methodology to demonstrate how inpatient resources can be consolidated to achieve long-term cost savings.
- Hawaii Market – This application of the methodology emphasizes improving business processes and collaboration, and the potential to recapture indirect care volume through greater collaboration.

The findings and results of the Joint Assessment Study include market-specific and general recommendations regarding DoD/VA sharing opportunities, as well as recommendations on the methodology and approach to the Study. The following recommendations apply specifically to the three Study Markets.

Puget Sound Market

The Study demonstrated that access to primary care services could be improved significantly by opening new access points and redistributing capacity from facilities with surplus capacity.

Mitretek recommends that the VA and DoD continue to move forward with their planning efforts to open new primary care access points in geographic areas that are currently underserved.

Additionally, on a broader scale,

Mitretek recommends that DoD and VA leaders in the Puget Sound Market area continue to use this data-driven methodological approach to further examine sharing opportunities in their Market.

Gulf Coast Market

Mitretek recommends that DoD and VA establish a joint task force to conduct an in-depth operational and facility assessment that includes a future model of consolidated Medical/Surgical care in Biloxi, MS, based on the present and projected demand of the beneficiaries.

This effort should set aside the uncertainty of policy-oriented issues such as BRAC and/or integration of GME programs. The detailed analysis should exhaust all avenues of care delivery models, with patient demand and health care needs as the central driver. Facility-specific considerations should be secondary in this planning process.

VA recently released the Realignment Study for VISN 16, which, through a cost/benefit analysis of several alternatives, concludes that all services currently offered at the Gulfport Division should be moved to Biloxi. This “preferred alternative” would allow for “prediction of the outcomes for veteran patient services in a single consolidated location, to produce a single standard of care.”² A separate alternative included a “sharing agreement for provision of clinical services with Keesler” which was retained, as “local command support for sharing may change again during the CARES process.”³ The current direction of this VA study demonstrates a lack of collaborative planning on the part of both Departments.

Mitretek recommends that VHA refrain from drawing any conclusions (and retract any offered) until a detailed reexamination of the Keesler alternative is conducted with DoD representatives.

² Narrative component of VHA Realignment Study, VISN 16, November 21, 2003; p. 18.

³ Realignment Study, p. 18

The current “preferred alternative” includes renovation of 123,000 DGSF and new construction of 155,000 DGSF with total capital costs of approximately \$30M.⁴ Having applied the Study methodology, Mitretek feels that it would be premature to draw conclusions before assessing a consolidated delivery model for services duplicated between DoD and VA, given the remarkable proximity of these three facilities.

Hawaii Market

During the Study site visits, DoD and VA stakeholders alike expressed need for additional specialists—particularly in Gastroenterology, Cardiology, and Dermatology. The Indirect Care analysis underscores the need for collaboration in physician recruitment and employment for these specialties.

Mitretek recommends that the two Departments work closely to analyze the volume and type of indirect care activity—especially in specialties where the combined indirect care volume could justify jointly employing a specialist.

For most specialties, the two Systems should first determine whether there is excess provider capacity in either System. For example, if DoD has excess capacity in a specialty, it should first attempt to recapture “leaking volume” to use up its capacity. If, after recapturing volume, some excess capacity remains, VA could take advantage of this opportunity to reduce fee-basis care.

Likewise, the Systems should identify and describe DoD indirect care activity for Mental Health and Rehabilitation and determine whether the DoD direct care system has capacity to recapture the purchased services. If so, DoD should encourage beneficiaries to use the direct care system. If not, the Systems should determine whether VA has capacity to support some of the DoD’s needs.

Because of the dynamic nature of the deployment of DoD specialists, Mitretek recommends that DoD and VA together evaluate whether jointly employing specialists will help to equalize availability and access.

Mitretek recommends that the two organizations, using the Collaboration Framework, continue to pursue the opportunities identified during the site visits. However, these efforts need to proceed in an orderly, systematic, and information-driven manner. Leadership of both organizations must remain visionary and revitalize formal joint strategy, business, and facility planning efforts.

Other Sharing-Related Findings

Mitretek’s field work revealed a large number of potentially valuable sharing opportunities that are applicable to all Markets. Mitretek characterized these into three levels, as shown below. The Study findings from Puget Sound, Gulf Coast, and Hawaii are specific examples of Level II-type findings. Mitretek believes this systematic

⁴ Realignment Study, pp. 4 and 8.

description of the range of complexity and difficulty associated with collaboration provides a useful framework for continuing discussions between the two Systems.

- **Level I (Opportunistic)** sharing opportunities represent activities that mostly focus on logistics, staffing, and business and system processes and/or improvement of sharing activities currently in place. Mitretek considers Level I sharing to be largely invisible to patients, locally-managed, and easiest to accomplish.
- **Level II (Actionable)** sharing opportunities tend to involve patient movement, delivery resources, or development of patient care facilities. Level II opportunities imply capital or other types of investment, and some stakeholder resistance; they are thus harder to accomplish.
- **Level III (Transformational)** sharing activities are difficult to achieve and yet have the highest potential impact on cost, quality and/or access to care. Examples of Level III sharing opportunities include: development of interoperable IM/IT systems and common medical records, single governance and management within defined market areas, and unified GME and research programs. Additionally, Level III opportunities may involve major policy changes, and/or significant degrees of direction and guidance from national headquarters.

Findings and Recommendations Relative to the Data Repository and Analytical Methodology

Mitretek recommends that DoD and VA officials continue to develop and refine the quantitative methodologies used in this Study, with particular attention to addressing and resolving the following issues: Data Acquisition, Data Integration, and Demand and Capacity Conversion Factors.

This Study used patient-record-level detail as the major component of the Data Repository. This yields several challenges, including the enormous size of the requested data files, and patient confidentiality issues. When this Study methodology is repeated, the project timeline should consider that the size and confidentiality issues will result in a long lead time required to obtain the data.

Further, the data itself requires filters, assumptions, groupers, etc., in order to convert record-level detail into valuable decision-support information. It required considerable expertise in database management and health care planning, as well as familiarity with the structure and contents of the DoD and VA datasets, to accomplish this task.

Mitretek recommends that future Studies also employ a multidisciplinary team of database management and health care planning experts.

To determine where current and future imbalances between the demand and the supply in a particular market might exist, Mitretek converted demand into encounter-level/workload data and converted supply counts into capacity. In most cases, the datasets included data at the workload level, sufficient for comparing demand to capacity. This Study developed initial Demand and Capacity Conversion Factors to facilitate such an analysis in the future.

Mitretek recommends that DoD and VA use the Collaboration Framework in other markets, adapting it as necessary to apply to any market.

The Collaboration Framework proved to be a highly useful and well-received means of addressing the complex dynamics experienced by those responsible for carrying out collaboration and sharing activities.

Summary

Adopting both the quantitative and qualitative frameworks developed in this effort allowed Mitretek to carry out the two major objectives of the Study. Specifically, the Study team was able to identify and assess multiple sharing opportunities available in each of the three Study Markets and to create a replicable methodology for use in other markets.

Mitretek believes that the DoD and VA should continue in their exploration, evaluation and implementation of collaboration initiatives. The methods developed in this Joint Assessment Study provide DoD and VA officials with additional decision-support tools that can be applied in other markets.

Study Report

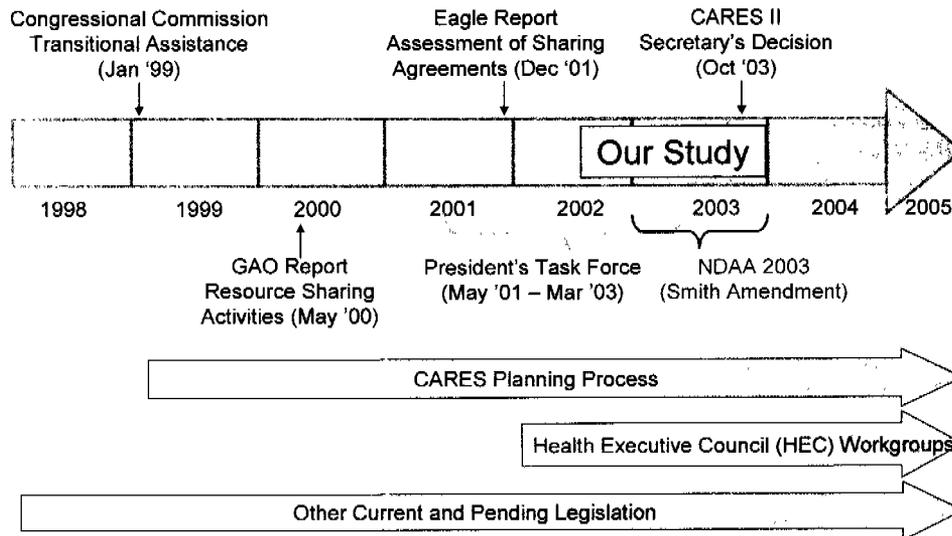

1.0 INTRODUCTION

1.1 The Problem and the Mandate

Since the passage in 1982 of the Veterans Administration⁵ and Department of Defense Resource Sharing and Emergency Operations Act, VA and DoD have had a number of successful experiences in sharing resources and capabilities between their respective health care delivery systems, improving access and quality of care, and reducing costs. In April 2002, the VA/DoD Joint Executive Council (JEC) reported that there are currently over 600 sharing agreements in place between the two departments, covering over 6,000 instances of sharing services.⁶

However, the pressure for greater change has been increasing (see Figure below), in part because the pace of change has been relatively slow, and the results relatively modest, given the size of the respective organizations. In 2001, a VA study estimated that sharing and collaboration efforts between DoD and VA make up less than one percent of their combined health care budgets.⁷ More recently, the *President's Task Force to Improve Health Care Delivery for Our Nation's Veterans* (PTF) reported that the VA and DoD have had a mixed record in carrying out the mandates to improve collaboration and sharing. The PTF concluded that substantial opportunities remain for increased collaboration between the two departments.

Figure 1: Increasing Pressure for Change

Recent Congressional direction reflects the increased emphasis on expanding the scope and extent of sharing and collaborative efforts between DoD and VA. Section 8147 of the FY02 Defense Appropriations Act mandates that the Secretaries of Defense and Veterans Affairs jointly conduct a comprehensive assessment to identify and evaluate

⁵ Re-established in 1989 as the Department of Veterans Affairs.

⁶ Joint Executive Council Strategic Plan

changes to DoD and VA health care delivery policies, methods, practices and procedures, in order to provide improved health care services at reduced costs to the taxpayer.

1.2 Objectives of the Study

To implement the Congressional mandate, the Office of Special Programs, TRICARE Management Activity (TMA) contracted with Mitretek Systems (Mitretek) to conduct a Joint Assessment Study. There are two key objectives for the Study. The primary objective is to explore the sharing options that exist between DoD and the VA, and identify the most promising sharing opportunities to pursue, based upon their demonstrated potential to improve access to and the quality of the health care services provided, and to reduce costs to the taxpayer in the future.

The question that the Study addresses with respect to this objective is:

What is the best approach (or combination of approaches) for organizing the resources of the DoD and VA in a specific market area to deliver accessible, efficient, and high quality health care services to meet the needs of its respective eligible beneficiaries?

The Study focused on examining collaboration and sharing opportunities—and potential implementation actions—for three specific DoD/VA Market Areas. TMA directed that, to be successful, the Study should include an “[assessment] of the probable first-order impacts of further integrating the DoD/VA systems,” including “the impact of integration on beneficiary access, utilization efficiency, operating costs and capital investment requirements.”

The second objective of the Study was to develop a data repository and analytical methodology that can be repeated at other sites or on a national scale. The questions that the Study addressed with respect to this objective were:

- *Can the Study team develop an effective joint market planning approach to identify market-specific opportunities to enhance beneficiary health care services through improved coordination, collaboration, and communication between the two Departments?*
- *Can this joint market planning approach and its underlying methodology be readily adapted to the specific circumstances of other markets, i.e., can the methodology be replicated?*
- *Will the Study approach and methodology identify the most promising opportunities to achieve partial or full integration in areas where these efforts would have a favorable impact?*

Mitretek is pleased to report that the answer to all of these questions is “Yes.”

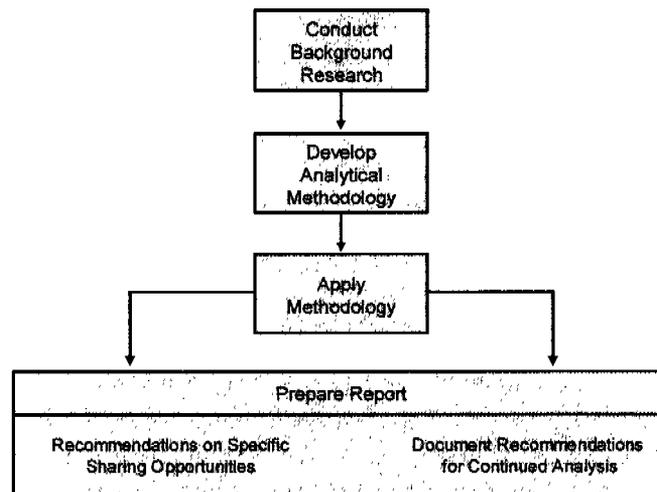

1.3 Required Efforts

As defined in the Statement of Work for this effort and depicted in the figure below, the Study Team was required to carry out four distinct efforts. These are:

- Conduct background research on the history and issues regarding sharing and collaboration between DoD and VA.

- Develop a standard, replicable methodology to identify the most promising sharing and collaboration efforts. The methodology was intended to include two major components:
 - A standard data repository integrating relevant data from both DoD and VA sources; and
 - Analytic tools, methods, and procedures using a common approach to address the primary Study question in detail.
- Apply the methodology in three Study Markets (Hawaii, Puget Sound, and the Gulf Coast) by:
 - Assembling the pertinent data;
 - Analyzing the data and information; and
 - Assessing sharing/collaboration opportunities and impacts, including market-specific opportunities, general opportunities, and recommendations regarding methodology.
- Prepare a final report documenting the Study effort and its results.

Figure 2: Joint Assessment Study Requirements

In developing its overall concept for executing these tasks, Mitretek considered that the value and worth of any identified sharing opportunity would be judged by the extent to which it increased access, improved quality, or reduced costs—and potentially all of these to some extent. Identifying those sharing and collaboration opportunities that could improve access (as the starting point) required the creation of a comprehensive database including information and data on:

- The demographics and origin of eligible and enrolled DoD and VA beneficiaries;

- Similar data for those beneficiaries using their respective health care delivery systems;
- The volume and characteristics of the services provided, including outpatient visits, inpatient discharges, bed-days of care, diagnoses, procedures, and locations of service, including direct and indirect care;⁸
- The supply of resources—including staff and physical space—and the capacity of each facility to provide these services; and
- The costs of providing these services.

The assembled data supported the quantitative analyses performed to identify the most promising and desirable opportunities for increased sharing and collaboration through possible redistribution of care access points, providers, or locations where care can be most efficiently rendered to a Combined Beneficiary population. However, Mitretek determined that this result, while necessary, was insufficient to achieve the overall Study objectives; while desirable, these opportunities may not be completely *feasible* (recognizing that, in reality, there are two very large, mature, and well-entrenched health delivery systems already in place). The numerous mission, policy, infrastructure, and organizational culture issues that simultaneously distinguish and divide the health care delivery operations of the Departments of Defense and Veterans Affairs raise practical challenges to implementing a large number of very important and desirable sharing opportunities.

These sharing opportunities, which cut across traditional boundaries between the two Systems of health care delivery, may involve a host of commonly provided activities. These range from clinical practices to electronic exchange of information, to administrative practices, to pursuit of important educational agendas. The mission statements of both VA and DoD health care delivery systems articulate that patient care is the central focus. Both organizations have national security matters as a central component of their missions; in the case of the DoD, it is its reason for being, and VA serves as its contingency back up. Additionally, both organizations have similar goals in—but different approaches to—their education and research missions.

It is within this context that Mitretek has approached the Study: recognizing the thicket of complex matters while simultaneously developing a quantitative methodology to highlight potential sharing opportunities. This Study takes a holistic approach—both “calling it by the numbers” and also respecting the many organizational barriers and enablers to collaboration.

1.4 Highlights of Study Accomplishments

The following highlights reflect the major accomplishments of this Study. Mitretek:

- **Created the “Combined Beneficiary” perspective for evaluating sharing opportunities.**

This Study demonstrated that every local market area can potentially have very different characteristics, which can be illuminated by the application of the

⁸ Indirect care is defined as purchased care by the DoD and fee-basis care by the VA

market-based Combined Beneficiary perspective developed in this Study methodology. The degrees of sharing and/or collaboration that exist between agencies today, imbalances between the locations of populations needing care and the two agencies' resources, and how much care is being provided directly versus being purchased for these beneficiaries, are all variables that can be quantified for each local combined market. This is critical since the nature of those targets of opportunity for greater sharing that will most benefit the patients and the taxpayers will vary from market to market.

- **Combined all the necessary planning data to comprehensively and systematically identify market-wide sharing opportunities.**

The combined market and delivery system perspective that the Study methodology creates incorporates data related to the services required by beneficiaries of both DoD and VA, the resources available within both systems combined to meet these needs, and the care purchased by these agencies for these beneficiaries. As such, this approach provides the most complete picture of the demand for health care services by these beneficiaries in a market, and of the total resources that these two Federal agencies have currently committed to meet these needs.

- **Produced tools and methods that can be consistently applied to evaluate the merits of sharing opportunities.**

The Study methodology, which utilizes the quantitative workload and capacity information available from both systems, provides a useful “scorecard” and a relatively comprehensive approach for identifying and analyzing the impact on care delivery of greater sharing and collaboration between VA and DoD. During site visits, Mitretek observed that, while there were many sharing and collaboration issues and initiatives being considered by both systems, these discussions often occurred without an understanding of the overall range and depth of care delivery in the market. There was often a lack of context in which to frame the potential improvement represented by a particular initiative, no method to evaluate it, and no consistent way to compare it to other, equally intriguing ideas. The comprehensive, data-driven, market-wide perspective used in the methodology and analyses developed for this Study is a significant contribution to DoD and VA joint planning efforts, now and in the future.

- **Met the Study objectives to measure the benefits of sharing opportunities on beneficiaries and the taxpayers.**

Meeting the primary Study objective itself was a significant accomplishment in the evolution of joint planning efforts between DoD and VA. The data-driven approach that has been developed through this Study can help to both identify opportunities for sharing that will have a beneficial impact on the systems' beneficiaries and the taxpayers, and measure the relative impact of options on overall access and system-wide costs.

- **Built a foundation for future Federal planning initiatives.**

This approach incorporates extensive research on past and current sharing initiatives, builds upon those, and provides a stronger foundation to support other planning initiatives underway and/or on the horizon (e.g., Smith Amendment). The analytical tools and techniques developed as part of this Study methodology provide a valuable starting point for the two agencies to develop the type of uniform resource planning standards that are essential for the effective joint planning of their combined resources. Examples include the capacity conversion factors and the tools developed to map clinical workloads from the two Departments into commonly defined product and service lines.

- **Developed categories and lists of sharing opportunities common to all markets.**

The list of promising opportunities is extensive; however, recognition of the impact of the disparate missions of these two organizations is a critical step in understanding barriers to collaboration. The approach and methods used in this Study are designed to enhance the respective missions by focusing on potential enablers necessary for the implementation of sharing activities. The Study identifies nine domains of collaboration and three levels of effort that are required to address the most promising sharing opportunities.

- **Recognized that integration can happen at many different levels within organizations to achieve desired results.**

In applying the Study methodology, Mitretek interacted with DoD and VA stakeholders at many levels of the organization, from national leaders of both agencies to the department-level line managers. With this perspective from the field in addition to the view from national headquarters, Mitretek recognized that full “integration” of services is not necessarily the best goal of VA/DoD sharing efforts; often collaboration at lower levels within organizations in local markets best fits the needs of the populations or the specific clinical services in question and can achieve the desired results.

1.5 Organization of this Report

This report documents the results of the year-long Study. The main report (this volume) includes the following:

Executive Summary

- 1.0 Introduction
- 2.0 The Approach and Methodology
- 3.0 Findings and Recommendations from Applying the Methodology to the Study Market Areas
- 4.0 Findings and Recommendations from the Research and Field Work
- 5.0 Findings and Recommendations Regarding the Methodology and Continued Analysis and Sharing Opportunities

In addition, the Appendices provide much greater detail on several key areas of the Study. These include:

Appendix A: Market Assessments (for the three Study Markets)

Appendix B: Developing a Study Methodology – A Formula for Identifying and Assessing Sharing Opportunities in Other Markets

Mitretek believes that its efforts in conducting the Study, as documented in this report and the detailed supporting Appendices, successfully addresses the intended Study objectives and requirements.

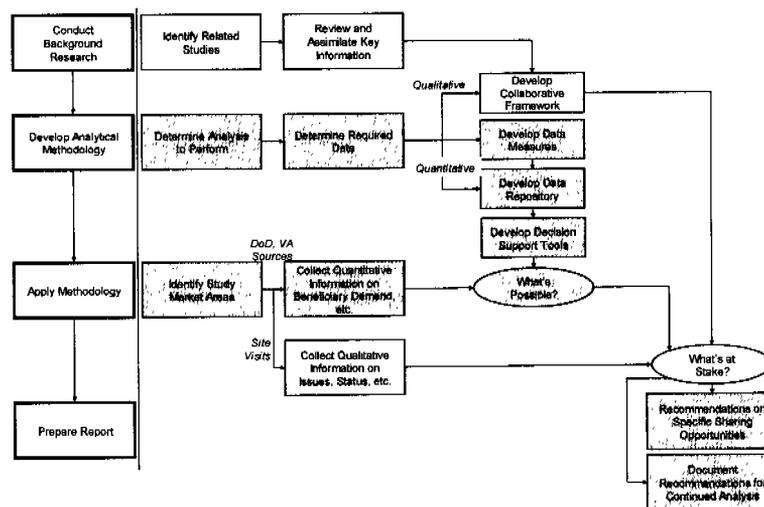

This page intentionally left blank.

2.0 APPROACH AND METHODOLOGY

2.1 Overview

As described in Section 1.0, the Statement of Work for the Study required that Mitretek carry out four distinct efforts: conduct background research, develop the analytical methodology, apply the methodology to the three identified Market areas, and prepare a written report to document the Study results. The figure below depicts in more detail how Mitretek approached and carried out the Study.

Figure 3: How the Study Approach Was Carried Out

The overall approach to the Study involved considerable interaction with client teams through interviews, visits to existing DoD/VA Joint Venture sites, in-process reviews with members of the Joint Facilities Work Group of the Health Executive Council (HEC), and field work within each of the three Study Market areas. It also involved the development of a large Data Repository to collect and analyze beneficiary population and health care utilization and creation of decision-support tools used to assess potential sharing opportunities within the markets.

The major components of Mitretek's approach to conducting the Study are discussed in detail in the following four sections. For a complete description of the methodological approach, see *Appendix B: Developing a Study Methodology*.

2.2 Conduct Research

As part of the Joint Assessment Study, Mitretek conducted considerable research into the background factors affecting DoD/VA sharing and collaboration activities. This work was undertaken pursuant to the charge that "the contractor shall review pertinent studies, reports, analysis, etc. as they relate to proposals or initiatives associated with the integration of DoD/VA systems or efforts in whole or in part." In the Research effort, Mitretek had three main objectives to accomplish:

- To understand the context of DoD/VA organizational relationships.

- To get input into the Study design and methodology.
- To understand substantive matters: key elements, issues, barriers, and ingredients for successful collaboration.

2.2.1 Identify Related Studies and Existing Joint Ventures

The initial approach to conducting the research involved collecting and reviewing previously prepared documentation on the broad subject of DoD/VA sharing and collaboration. Mitretek reviewed a wide spectrum of reports, studies, websites, briefings and presentation materials. Information sources came from many government agencies, including the DoD and its component services, the VA, the Department of Health and Human Services (DHHS), Congressional committees and testimony, General Accounting Office (GAO), Office of Management and Budget (OMB), and the Congressional Budget Office (CBO). Additionally, the team referred to non-government documentation relating to the planning of large health delivery systems. A list of reference documents collected and reviewed as part of this research investigation is presented as *Attachment 1 of Appendix B*.

2.2.2 Conduct Field Visits

Per the Statement of Work directive that Mitretek “conduct field visits to DoD/VA medical centers involved in significant joint ventures,” Mitretek visited the following Joint Venture sites to investigate what is working well and what barriers the staff, leaders, and others have encountered in their sharing efforts:

- David Grant Medical Center (Travis AFB) and VA Northern California Health Care System in Sacramento and Fairfield, CA
- Kirtland AFB Clinic and Albuquerque VAMC in Albuquerque, NM
- Mike O’Callaghan Federal Hospital (Nellis AFB) and VA Southern Nevada Health Care System in Las Vegas, NV

A summary of findings and conclusions from the research was presented to the Joint Facilities Work Group and has been used in the development of methods and tools used to assess sharing opportunities in the Study.

2.3 Develop Analytical Methodology

Mitretek developed a methodology for the Study that includes both quantitative and qualitative frameworks for assessing sharing opportunities. The essential elements of these frameworks are highlighted below. Background information, specific assumptions, and detailed information about the methodology are contained in *Appendix B*.

2.3.1 Framework for Quantitative Analysis

This Study focuses its quantitative analysis on a population-based approach to measuring demand and supply of health care services in a given market area. The analysis of demand begins with the measurement of the combined DoD and VA beneficiary (Combined Beneficiary) populations and the historic workload

generated from these beneficiaries. The supply of health care services for a given market is measured by availability of clinical services, facilities and staff.

Mitretek based the quantitative analyses in this Study on the following major components:

- Population – The Study utilizes Combined Beneficiary populations, broken down by age, sex and beneficiary category. This includes all beneficiaries who are eligible for care, all those enrolled in either system, and all unique users who received care during the two-year timeframe used in the Study. Beneficiary population data were obtained from each System.
- Demand – The demand for clinical services is measured by actually counting workload generated by the beneficiary population in the individual Study Market areas. These data were obtained from record-level encounter data from the DoD and VA systems.
- Supply – The supply measures the availability of clinical services, staff, and facilities (staffed beds, productive spaces, etc.). Though this information was obtained primarily from the facilities in each market, Mitretek did obtain FTE data from national sources.
- Costs – Cost information is contained in the record-level encounter data and used extensively in measuring average costs at a clinical service-line level.

In the development of the quantitative measures used in this methodology, Mitretek created analytical tools to measure the gap, if any, between the demand and supply of clinical services. Mitretek developed additional tools to analyze the access to and costs of the clinical services within the defined Study markets. These analytical tools (and the data required to use the tools) are described below.

- Clinical Service and Product-Line Crosswalk Tables – Both the DoD and VA systems aggregate clinical services in various product lines. In order to “map” these product lines between the two systems, Mitretek created crosswalk tables to allow for common groupings of services necessary to measure demand, supply and cost and to better understand the capacity of each system to accommodate clinical service workloads.
- Capacity Conversion Factors – Mitretek developed these factors in order to convert the supply of services into capacity estimates. For example, in order to measure actual inpatient capacity within a market, analysts must convert the number of staffed beds into available bed days of care, using occupancy targets. Similarly, analysts must convert the supply of clinical providers into clinical full-time equivalent (CFTE) availability in order to factor in the non-clinical duties of the providers. These factors, which are explained in detail in *Appendix B*, were derived from published DoD, VA, and commercial standards, or were based on the experience of the Study team.
- Access Measures/Drive-Time Analysis – Mitretek measured access to primary care and to inpatient services—based upon beneficiary residence at a ZIP code

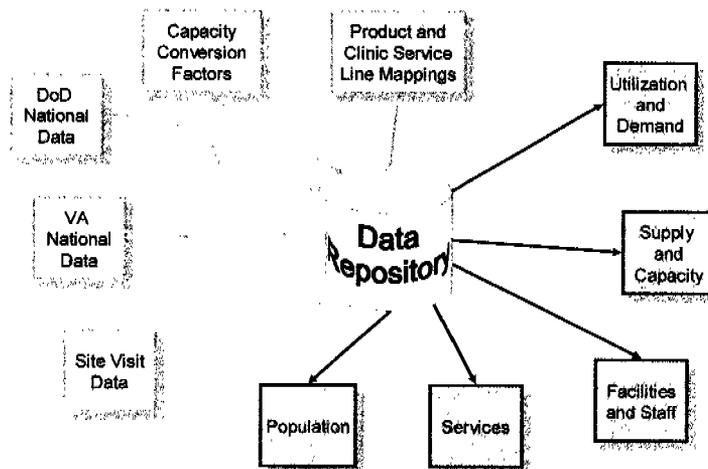

level—using geographic information systems technology. These data were also extracted from the record-level encounter data cited above.

The development of the quantitative analysis requirements and tools allowed the Study team to determine the appropriate data request and to develop, as part of the methodology, a Data Repository to receive and process large volumes of record-level and other data. The next section summarizes the essential elements of the Data Repository.

Design the Data Repository

Data sets obtained from DoD and VA sources were integrated with one another, and then with information collected in the field during site visits. The figure below represents both the quantitative inputs to the Data Repository, and the major resulting data sets that were extracted.

Figure 4: Data Repository Inputs and Outputs

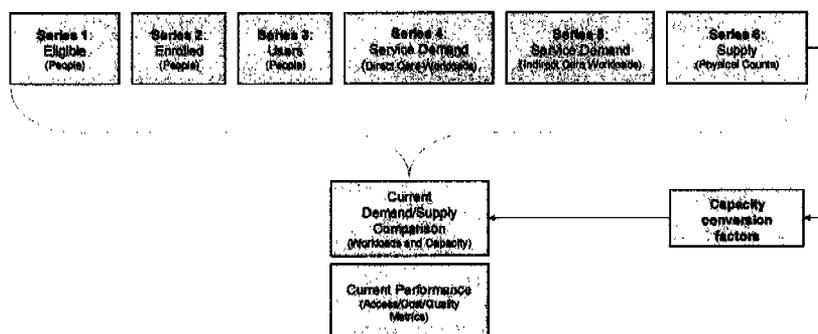

The purpose of the database design was to merge the different data sets together into one universal database. An Entity Relationship Diagram representing the data elements and tables in the design can be found in *Appendix B*.

In addition to the clinical service and product-line crosswalk tables described above, data mapping was required in order to categorize the pertinent data elements from the DoD and VA data. Mitretek team members examined field definitions outlined in the source data dictionaries, identified and categorized each field into the corresponding entity in the data model, and mapped key fields to the appropriate data elements for each service. For example, a Department Mapping table was created to group site-specific data into a standard set of operational departments.

Develop and Build Analysis & Decision Support Tools

Several data analysis and integration tools were developed after the Data Repository was created. Data analysis “shells” (or standard report templates) were developed in order to synthesize the data for analysis. This series of analytical data tables is illustrated in the figure below.

Figure 5: Illustration of the Series of Data Tables Employed in the Analysis

The data analysis shells used to create the report templates served as the basis for analysis. Stored procedures and queries were structured to produce the necessary outputs for each pivot table series. An iterative process of executing the queries and analyzing the results was essential to understanding the complexities of the data and to generating the final Market assessments.

Documentation of the Data Repository and decision-support tools provides an essential baseline for replicating the quantitative analysis in the Study (see *Appendix B* for more detail).

2.3.2 Framework for Qualitative Analysis

Another essential part of the Joint Assessment Study methodology involves measuring overall relationships between DoD and VA facilities and personnel within the Study markets. Mitretek developed a framework for assessing these relationships and for measuring the impacts on potential sharing opportunities. This Collaboration Framework is described in the following paragraphs.

There are four components to Mitretek’s Collaboration Framework: identification of the major categories of collaboration, definitions of collaborative terminology, a “Gold Standard” or ideal effect of the collaboration categories, and a relationship continuum grid that combines these.

Mitretek’s research suggests that collaboration activities and organizational relationships fall within one or more of nine domains: Clinical Workload, Facilities & Equipment, Staffing & HR, Governance & Management, Business Processes, Information Management/Information Technology (IM/IT), Logistics, Education & Training, and Research. Each of these domains is a potential

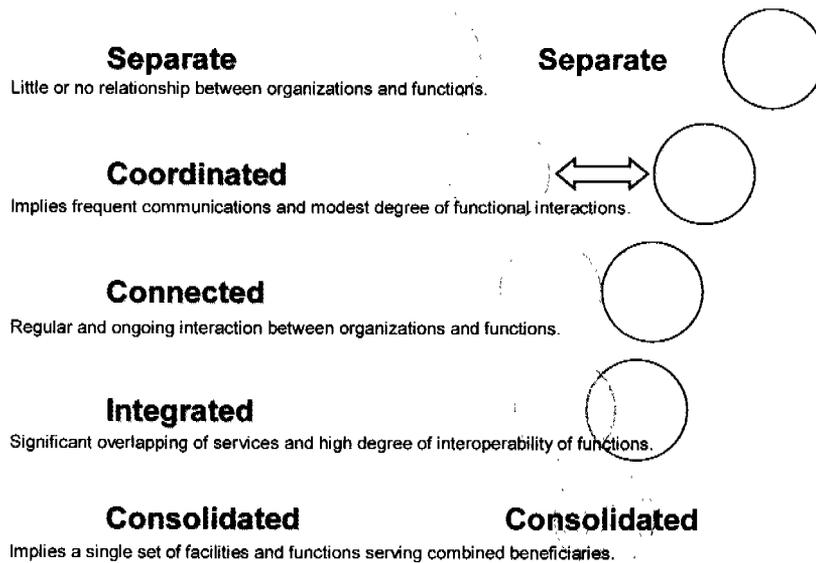

collaboration area, which can help to achieve effective care delivery. The table below details the influence of each of these domains on collaboration efforts.

Table 1: Domains of Collaboration and Their Influences

Domain	Influence on Collaboration
Clinical Workload	Determines need, demand, and patient flow
Facilities and Equipment	Influences supply/capacity
Staffing & Human Resources	Influences supply/capacity and skills maintenance
Governance and Management	Provides structure and leadership
Business Processes	Organizes work flow
Information Management/ Information Technology	Informs decision making throughout the organization
Logistics	Provides material support, including pharmaceuticals
Education & Training	Fuels development of competent workforce
Research	Enhances advancement and exchange of knowledge

Mitretek discovered in its field work that stakeholders in potential sharing endeavors were confused by inconsistent terminology for collaborative efforts. The figure below illustrates demarcations and definitions for several terms—Separate, Coordinated, Connected, Integrated, and Consolidated—that can be useful in discussing collaboration opportunities.

Figure 6: Suggested Definitions for Collaborative Spectrum of Terms

Essentially, these terms describe a continuum of possible degrees of relatedness that can exist among or between organizations. These are relative definitions

only; Consolidated is not necessarily the preferred end-state of a given joint sharing venture. This continuum can apply to multiple and differing levels of relationships within any organization or group of organizations (e.g., DoD-to-VA, or facility-to-facility relationships within a local market, or within specific service line or support service interactions among facilities).

The challenge in making these distinctions is to determine the level and extent of collaboration that could exist among and between organizations, while recognizing that usually multiple sets of functioning relationships are involved.

Market- and facility-specific information can be displayed in a relationship grid, which matches the five elements of the collaboration continuum with the nine domains of collaboration (see the table below).

Table 2: Relationship Grid/Relationship Continuum

	Separate	Coordinated	Connected	Integrative	Consolidated
Clinical Workload	Insignificant referrals	Regular communications	High numbers of referrals	Significant number of referrals as one	Consolidated referrals
Facilities	Distant	Some sharing where duplication exists	Projects & facilities come from master planning	Many departments share space	Consolidated facilities
Staffing	Distinct	Support in peaks and valleys	Joint staff planning	Multiple examples of single/joint staffing	Consolidated staffing
Business Processes	Different	Reduce barriers	Work flows understood & acted on	Transparent	Consolidated business processes
Management/Governance	No Relation	Joint planning sessions	Overlap of some key functions	Overlap of many key functions	Consolidated management/governance
IM/IT	Separate systems	Evidence of electronic exchange of info	Moving toward systems interface	Complete interoperability	Consolidated IM/IT
Logistics	Little, if any, exchange	Borrowing, bartering and contractual exchange	Mutual examination of best pricing and service	Selective joint contracting in major areas of procurement	Consolidated logistics
Education & Training	Distinct	Selective exchange of methods	Frequent use of joint programs and curriculum	Most programs and curriculum are same/similar	Consolidated education & training
Research	Distinct	Selective exchange of protocols	Joint planning and review of many studies	Significant overlap of protocols and review	Consolidated research

While it is necessary to understand the nature and degree of collaboration present within a market, a far more important question is, "How effective is this collaborative relationship?" Measuring performance at any level within a health care organization (or group of organizations) is complex. In its simplest form, one can ask, "How are we doing generally within each domain?" One technique

is to articulate an ideal or "gold standard" for comparison. The table below presents statements of an ideal condition within each domain.

Table 3: Gold Standard/Ideal

Clinical Workload	Timely, best care placement, and follow-through of patient, based on population-generated demand, regardless of origin
Facilities	Attractive, accessible facilities and equipment sufficient to serve needs of population without duplication
Staffing	Provision of well-trained and competent staff appropriate to the demand
Business Processes	Ability to work in ways that are fast and accurate, exhibit smooth handoffs, and please constituents
Management/ Governance	Effective oversight of entire enterprise, and ability for timely and effective execution of line and staff activities
IM/IT	Electronic, appropriate, accurate, secure, interoperable
Logistics	Best quality, materials at the right place, right time, and best cost
Education & Training	Perpetual development of highly capable professional, technical, and service workforce
Research	Continual advancement of knowledge that contributes to improved performance and effective outcomes

Another useful approach entails a general assessment of the contribution of the collaboration to overall organizational performance—gauged against where the organization could or should be (with respect to an ideal state). This activity helps determine the degree of collaboration that best fits the needs of the affected facilities or services. Such an assessment can help organizational leaders make informed decisions about the relatedness and organizational models that may best serve the beneficiaries within a specific market and meet the needs of their organizations.

The quantitative and qualitative assessment frameworks described above were developed for the Joint Assessment Study and have been designed to be re-usable (or repeatable) as part of a consistently applied methodology with the potential for use in other markets. The following section summarizes the application of the combined assessment methodology to the Study Markets.

2.4 Apply the Methodology to Study Markets

2.4.1 Identify Study Market Areas

The Health Executive Council determined which general market areas were to be included; however, Mitretek further defined the market and submarket geographies as a first step in the Study methodology. Application of the methodology involves using ZIP code- and county-level information to find the best union of the existing VA and DoD market definitions. Mitretek defined market areas as the smallest geographically delimited area that encompasses both

the VA VISN market (and/or submarkets, where defined) and the catchment areas of the DoD Military Treatment Facilities (MTFs) located in this VA VISN market.

In the Joint Assessment Study, applying this logic resulted in the following Market areas:

- Puget Sound – Sixteen counties in western Washington, consistent with the VA CARES “Western Washington” submarket;
- Gulf Coast – Eighteen counties: seven in the western panhandle of Florida, four in southern Alabama, and seven in southern Mississippi. Although this Market is not congruent with the markets used for CARES planning, it is the current geographic area of responsibility of the VA Gulf Coast Health Care System, headquartered in Biloxi, MS.
- Hawaii – The entirety of the Hawaiian islands (5 counties, but only 4 with DoD or VA beneficiaries)

Maps of the three Market areas are included in *Appendix A*.

After Mitretek identified the proposed market areas for the Study, they used the geographic boundaries of the market areas as parameters in subsequent data requests and analyses.

2.4.2 Collect Information

Mitretek requested data from national VA and DoD sources and received more than 15 data sets and over 55 million records. These data were coordinated in the Data Repository (described above) that allowed information from disparate data sets and the two Systems to be viewed together for the first time in a decision support format. Combining these files in a relational database was an extremely complex task, but ultimately allowed Mitretek to view the population, demand, supply, cost and capacity data at a market (and submarket) level.

The Study team also requested market- and facility-specific data directly from the facilities in preparation for site visits to each Market area. (Delays in obtaining national source data necessitated that Mitretek retrieve supplemental population and workload data for each Market prior to the site visits). Additional data on facility-specific floor plans and site plans were gathered on site. The Study team also requested and received information about the facility- and market-specific joint sharing agreements (proposed or already in place), and general mission, vision and strategic planning information.

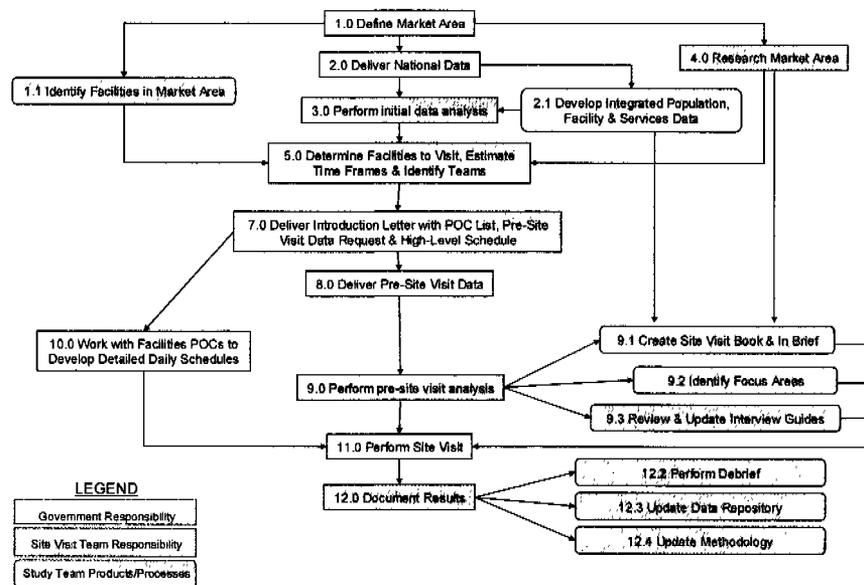

2.4.3 Conduct Assessment

The methodology for conducting the Market assessments included two site visits to each Study Market, first to collect and verify data, and then to test the initial results of the assessments.

The Study team met with leadership from both DoD and VA in each market, and conducted field visits to a total of 29 facilities. During the course of these visits, interviews were held with 395 individuals.

Activities related to preparing for and conducting the first site visit are displayed in the figure below.

Figure 7: Preparation and Execution of First Site Visits

Mitretek divided its members into four separate teams for interviews and facility tours during the first site visit. Each team's particular focus is described below.

- The **Leadership** team conducted interviews with executive and clinical leadership to gain perspective on current and future opportunities for improved collaboration. They verified populations served and performance of the current system, and captured viewpoints regarding planned or potential DoD and VA sharing opportunities and system changes that could improve care to beneficiaries in the future.
- The **Market** team conducted interviews with staff involved in planning and finance. They verified quantitative data and collected additional qualitative information related to beneficiary populations and current workload and provider staffing.
- The **Operations** team conducted interviews with key operational managers and clinicians and toured clinical areas to assess operations and facility capacity. They verified clinical capacity, assessed the appropriateness of a facility for current or projected future use, and identified any significant disconnects between actual capacity and required capacity
- The **Facilities** team toured major clinical buildings to assess facility condition. They documented their observations, findings, and impressions with

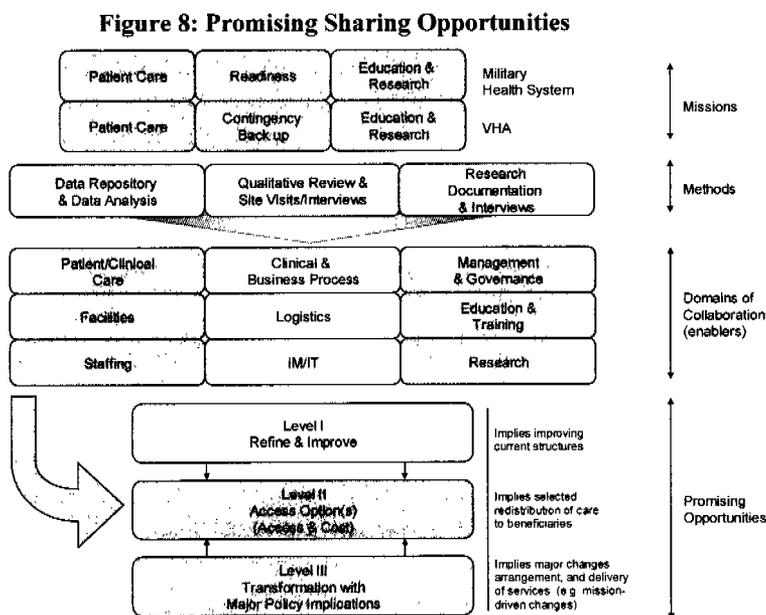

recommendations for further assessment. This information was later incorporated into the Study Data Repository.

2.4.4 Conduct Analyses

Following the first set of site visits, Mitretek initiated analytical activities to:

- Determine the baseline demographics, workload, cost, access, and conversion factors.
- Perform a supply and demand analysis; examine the supply and demand “gaps” that may lead to sharing opportunities.
- Measure the cost and access benefits possible by implementation of these alternatives.
- Integrate the findings from the qualitative assessment (using the relationship continuum grid).

The composite efforts of the quantitative and qualitative Study work were merged in the formation of a diagram Mitretek refers to as “Promising Opportunities.” This figure is shown below.

The diagram shows how issues flowing from mission-driven considerations (both common and distinct) within DoD and VA inform both the domains of collaboration and the processing of opportunities within each domain, as well as the potential actions that DoD and VA officials could pursue.

Specifically, certain actions regarded as Level I (Opportunistic) can generally be undertaken by local authorities and are intended to refine and improve collaborations such as those involving local business processing matters. Level II (Actionable) opportunities have a significant patient care focus that influences the realignment of patient points of access. These opportunities are quantitatively

tested in the Study methodology. The Level III (Transformation) opportunities consider initiatives that are most effectively addressed at a national level.

Mitretek used a second round of site visit to review the progress of the Study, and to gain feedback from the field regarding the approach, methodologies, assumptions and overall findings related to opportunities uncovered in our interviews and data analysis. The team presented a high-level overview in a joint session with representatives from both organizations at the local level, and then conducted workshops to drill into the data, framework, and assumptions.

The team answered questions from the field regarding the process and methodology, and showed the staff in the field how the information could be useful, should they choose to undertake further investigations into sharing opportunities at the local level.

2.5 Develop and Prepare Report Recommendations

The application of the Study methodology resulted in several useful reports, including Market and Submarket profiles of health care demand and utilization patterns, information on beneficiary populations, summary data related to supply and capacity, and qualitative information regarding potential sharing opportunities.

During the course of the Study, Mitretek generated other informative reports covering topics such as a *Summary of the VA CARES Process*, relevant findings from *The President's Task Force (PTF)* reports, and a summary of *Research Findings on DoD/VA Joint Venture* site visits. Information from these internally developed reports has been incorporated into this overall Study Report.

2.5.1 Document Recommendations Regarding Potential Sharing Opportunities

Section 3.0 of this Report documents Market-specific findings and recommendations, which flow from the quantitative and qualitative assessments carried out as part of the Study. More detailed findings and Market profile information are documented in *Appendix A*. (Much of the information contained in the Market-specific reports was also presented to site leadership and other representatives during the course of the assignment. The briefing materials used during site visits and In-Process Reviews are available from the TMA Office of Special Programs.) General Study findings and recommendations are contained in *Section 4.0*.

2.5.2 Review Lessons Learned and Develop Recommendations Regarding Data Requirements, Methodology, Etc.

The Study methodology, including supporting tools (e.g., the Clinical Service/Product Line Crosswalk tables) is documented in *Appendix B*. This document is an integral part of the overall Study, and will be particularly useful in future efforts to repeat the Study methodology and process. The findings and recommendations related to the application of the Study methodology are contained in *Section 5.0*.

3.0 FINDINGS & RECOMMENDATIONS FROM APPLYING THE METHODOLOGY TO THE STUDY MARKETS

3.1 Introduction

This chapter summarizes and provides highlights of the application of the Joint Assessment Study methodology to three Market areas: Puget Sound, Gulf Coast, and Hawaii⁹. A number of the aspects of the applicable methodology that apply to all three Markets are discussed briefly in the subsections that follow. The individual Study Market assessments are summarized in *Sections 3.2, 3.3, and 3.4.*

3.1.1 Combined Beneficiary Perspective

The Market assessments adopt a unique perspective—that of a Combined Beneficiary. A Combined Beneficiary is a current DoD, VA or dually eligible beneficiary, for whom health care access, cost and quality would be improved if sharing and collaboration between DoD and VA were increased. Adopting this perspective frames the Market assessments to address the common and best interests of the Combined Beneficiaries in the Market as a whole, rather than the potentially conflicting interests of the two delivery systems taken separately.

3.1.2 Defining Markets and Submarkets

In the DoD/VA Joint Assessment Study, each Market area was defined geographically, at both county and ZIP code levels. To the extent feasible, Mitretek used existing VA and DoD market definitions – i.e., a Market area in the Study is the smallest geographically-delimited area that encompassed both the VA VISN-based and DoD MTF catchment-based Market area definitions.

Additionally, Mitretek subdivided the Market area into smaller geographic units—Submarkets—for meaningful analysis. Submarkets were defined based on existing geo-political boundaries (i.e., counties), taking into account topographical features that may practically distinguish one Submarket from another (e.g., rivers, mountains, highway patterns, etc.).

It is important to remember that the designation of Market and Submarket areas are ultimately arbitrary; they are necessary to bound and limit the scope of the joint planning issues that the Study is trying to frame and address. The Market and Submarket area definitions can be expanded or contracted to accommodate changes in these issues.

In Puget Sound, the Study Market area consists of 16 counties in the state of Washington, consistent with the VA CARES “Western Washington” Market. This Market includes 14 DoD and VA health care facilities (including Troop Medical Clinics in Ft. Lewis). The Joint Assessment Study divided the Puget Sound Market along county lines into four Submarkets: North Sound, Seattle, South, and West Sound. Two of these regions contain both DoD and VA

⁹*Appendix A* contains more detailed information and data about the three markets and the application of the methodology to each of them.

facilities; the other two contain only VA (Seattle) or only DoD facilities (North Sound).

The Gulf Coast Market is comprised of 18 coastal counties, stretching approximately 240 miles from Panama City, FL to Biloxi, MS. This Market slices through VA's VISN 16 ("South Central") and DoD's Region 4 ("Gulfsouth"). This Market includes 18 DoD and VA health care facilities. The Market was divided into five geographically-based Submarkets: Biloxi/Gulfport, Eglin, Mobile, Panama City, and Pensacola. One of these Submarkets contains only DoD facilities (Eglin), and one of these Submarkets contains only VA facilities (Mobile).

In Hawaii, the Study Market is made up of four counties and four Submarkets.¹¹ The Submarkets are named for the main island in each county: Kauai, Maui, Oahu, and The Big Island (to avoid confusion with the Market name). This represents the DoD Hawaii TRICARE Region and the VA Pacific Basin Submarket (excluding Guam) of VISN 21. There are 14 DoD and VA healthcare facilities in this Market, four of which serve only active-duty beneficiaries.

3.1.3 Data Collection and Integration

The initial data collection goal was to obtain from each System data that are centrally stored and routinely maintained. Mitretek obtained data that are not centrally available from the local facilities via pre-site-visit surveys (and during the site visit process). The Study team developed methods and techniques to insure that the demand and supply data from DoD and VA could be aggregated to permit meaningful comparisons. As one of these methods, Mitretek developed a Product and Clinical Service Line Crosswalk,¹² to map the clinical volumes obtained from the data systems of each Department into consistent groups and categories, thus allowing for cross-Departmental analysis.

3.1.4 Demand and Workload

Mitretek estimated the demand for health care services by counting units of service used by the Combined Beneficiary population residing in each Submarket and Market. These demands, for both inpatient and outpatient services, may be accommodated at facilities within the Market area (in-market). Alternatively, beneficiaries may travel outside the Market to receive care (out-migration). Similarly, beneficiaries residing outside the Market may receive care from facilities within the Market (in-migration). The total health care workload at any facility is the combination of in-market and in-migration service volumes. Mitretek used discharges as the basic unit of service for inpatient care, and visits¹³ as the basic unit of service for outpatient care.

¹¹ The fifth county, Kalawao, is geographically very compact – and no Combined Beneficiaries live there.

¹² The PCSL Crosswalk can be found in *Appendix B-Attachment 3*.

¹³ Called "clinic stops" in the VA and "clinic visits" in the DoD. A visit is defined as one appearance by a unique person at an outpatient care clinic. During the course of one trip to a health care facility, a person may generate multiple visits by going to different clinics (e.g., primary care, radiology, pharmacy, etc.)

3.1.5 Supply and Capacity

Mitretek distinguished between the *supply* of a resource at a facility, and the *capacity* of that facility to provide or deliver services. “Supply” is typically a count of a particular resource, such as beds or the number of staff. “Capacity” is an estimate of the volume of services that can be provided at a facility, to meet the demand. For inpatient services, for example, the total number of beds at a facility constitutes Supply, and the number days per year the beds are available for use is that facility’s available Capacity. In outpatient services, it is necessary to convert Supply (number of FTE providers) into Capacity (number of annual visits these providers could perform). Mitretek developed methods for converting supply into capacity using a variety of measures for inpatient, outpatient, and diagnostic/therapeutic areas.

3.1.6 Identifying and Analyzing Options

A comparison of demand and supply identifies options for achieving balance within a Market or Submarket. Mitretek focused initially on the *desirability* of a particular option, specifically on the potential for a rearrangement of health care delivery volumes, capacity, and resources to improve access to care and/or to reduce the costs of delivering this care. Mitretek recognizes that this approach temporarily suspends consideration of the practical constraints on and real-world barriers to implementing the options that are identified as a result of this evolutionary process—their *feasibility*. Based on their site visits to the Markets, Mitretek is very aware of the specific challenges that influence opportunities for greater sharing and collaboration between DoD and VA. However, Mitretek believes that focusing on desirability first allows identification and calculation of the “benefits”—in improved access and reduced costs—of each option, and then to identification and estimation of the “costs” involved (i.e., the investments required to eliminate specific barriers to implementation).

3.1.7 Cost

Mitretek measured the cost performance of a particular sharing opportunity, or a set of opportunities bundled into one or more scenarios, by incremental changes to the total annual system cost in a particular market. The total baseline system-wide costs were established using FY02 data. These are the costs required to fund the care provided to the Combined Beneficiary population in the Study Markets, and include the annual costs associated with:

- Direct care services provided by the DoD and VA facilities located *within* the Study Markets to DoD and VA beneficiaries who reside within the Study Market area (in market);
- Direct care services utilized at *other* DoD and VA facilities outside the Study Market by beneficiaries who reside within the Market area (outmigration); and
- Indirect care services that are purchased *from other providers* by DoD and VA for their beneficiaries who reside within the Study Market area – i.e., purchased care.

Summing the FY02 cost data for each of these components of care delivery (i.e., all services provided directly by DoD and VA facilities, and those services purchased by DoD and VA for their beneficiaries who reside within the Market area) provides a complete picture of the total annual costs funded by DoD and VA to care for the Market Combined Beneficiary population.

3.1.8 Access

The Joint Assessment Study measures Access performance by the proportion of enrollees and/or patient care workloads—typically expressed as a percent—that are currently within the DoD/VA drive-time standards for geographic access to services. The access baseline for enrollees and for primary care workloads is measured based on the drive time to *any* facility within the beneficiary’s respective system (i.e., Mitretek assumes that all patients go to the nearest facility at which they are eligible to receive care). Access for inpatient care is measured based on drive time to *any* inpatient facility within the beneficiary’s respective system. The drive-time standards for DoD and VA are as follows:

Table 4: DoD and VA Drive Time Standards

Type of Service	DoD Standard	VA Standard	VA Rural Standard
Primary Care	30 minutes	30 minutes	30 minutes
Specialty Care	60 minutes	60 minutes	90 minutes
Inpatient Routine Care		60 minutes	90 minutes
Inpatient Tertiary Care		240 minutes	Within VISN

If a potential sharing opportunity increases the “percentage within standard” over the current access baseline, this represents improved access.

3.1.9 Facility Condition Assessments

Architects and engineers in the project team completed cursory reviews of many of the clinical buildings in the Markets. They subjectively scored the current conditions of clinical spaces and buildings so that service relocation options could be prioritized. Departments were scored on a Red/Amber/Green scale, and the buildings were scored on a Poor/Fair/Good/Very Good/Excellent scale. An explanation of the scoring and detailed scores of the many of the departments and buildings are available as Attachments to *Appendix A*.

3.1.10 Time

The Market assessments are based on a “snapshot in time” (FY02) and do not take into account the very dynamic nature of health care delivery in general and the policy changes affecting the DoD and VA in particular. For example, the impact of current decisions being made about provider availability, BRAC, CARES, and the next generation of TRICARE contracts are not accounted for in the Market assessments.

3.1.11 Collaboration Framework

As described in *Section 2.3.2*, Mitretek developed a Collaboration Framework to explore and systematically describe the domains in which sharing activities take place (such as business processes and information technology), and to identify the relative readiness and maturity of the local organizations involved to address and reduce the barriers to collaboration. Details about the methods and uses of the Collaboration Framework can be found in *Appendix B (Section 3.4)*.

3.1.12 Organization of the Study Market Summaries

The remainder of this chapter summarizes the findings and recommendations derived from applying the Study methodology to the Study Markets. Each Market-specific section is organized as follows:

- 3.x.1 A brief Market Description
- 3.x.2 Options for Sharing Identified
- 3.x.3 Findings from the Application of the Study Methodology to a Market Option
 - Baseline Situation
 - Market Demand
 - Supply and Capacity
 - Access
 - Cost
 - Impact of Options
- 3.x.4 Findings from the Assessment of this Market Using the Relationship Continuum
- 3.x.5 Recommendations

The central section of each market assessment summary (3.x.3) differs in its content, because each Market has unique issues, as detailed below.

Puget Sound: *Section 3.2.3* emphasizes access to primary care services, and uses the methodology to demonstrate how access performance can be improved significantly by opening new access points and redistributing capacity from facilities with surplus capacity.

Gulf Coast: *Section 3.3.3* focuses on the inpatient services within a particular Submarket, and uses the methodology to demonstrate how inpatient resources can be consolidated to achieve long-term cost savings.

Hawaii: *Section 3.4.3* emphasizes both improving business processes and collaboration (in a Market that already exhibits a high degree of physical integration), and the potential to recapture indirect care volume through greater collaboration.

These differences also highlight the flexibility and adaptability of the Study methodology to address the particular circumstances of local Markets. During its site visits to the Markets, Mitretek observed that, at the local level, these Markets are perceived as unique and, therefore, not easily subject to standard comparative analysis with other markets.

While it appears true that “all health care is local”, it remains important to plan for the delivery of health care services to Combined Beneficiaries from a comprehensive, data-driven, logically-developed, analytic foundation that highlights and respects local issues and perspectives, but incorporates them systematically into a broader methodological context. Mitretek believes that the results documented in this chapter demonstrate that significant progress has been achieved in developing this analytic foundation through the Study methodology.

3.2 Puget Sound

3.2.1 Market Overview

The Puget Sound Market consists of the following Submarkets, counties, and facilities.

Table 5: Study Market Area Definition for Puget Sound

Submarket	County	DoD Facilities	VA Facilities
North Sound	Chelan Island San Juan Skagit Snohomish Whatcom	– NH Oak Harbor – BMC Everett	
Seattle	King Kittitas		– VA Medical Center - Seattle – Seattle Shoreline Clinic (Contract)
South	Lewis Pierce Thurston	– Madigan Army Medical Center (Ft. Lewis) – 62nd Medical Group - McChord AFB – Okubo Family Practice Clinic – Ft. Lewis – Troop Medical Clinic #1 - Ft Lewis	– VA American Lake Medical Center
West Sound	Clallam Grays Harbor Jefferson Kitsap Mason	– NH Bremerton – BMC Bangor – BMC Keyport – BMC Puget Sound	– Bremerton CBOC

The Puget Sound Market area is unique in that it has two tertiary facilities (Seattle VAMC and Madigan), and that access to facilities is complicated by the many waterways in the area. Further, the area is known as a popular location for DoD retirees—thus there are a high number of “dual eligible” beneficiaries (i.e., those who are eligible for both DoD and VA benefits). This presents both challenges and opportunities. Although the combination of the using populations in the Systems is large, it may not be large enough to support two tertiary programs in some Service Lines (e.g., offering open-heart surgery at both VAMC Seattle and Madigan).

The topography of the Market makes meeting primary care access drive-time standards difficult—since towns that appear near to each other on the map are sometimes distant in terms of drive time (e.g., the need to take a ferry increases drive time). Since both Systems have 30-minute drive time standards for access to primary care, and in some Submarkets facilities exist for only one System, opening access to each other’s facilities has the potential to improve overall

access for beneficiaries in these Submarkets. (An analysis of the opportunity and impact of rationalizing access to primary care follows in *Section 3.2.3.*)

Beneficiary Populations

In 2002, the Puget Sound Market Area had approximately 740,000 eligible Combined Beneficiaries—approximately 55,000 of whom are “dual eligible” for both DoD and VA benefits. Sixty-four percent of the eligible population is VA eligible and thirty-six percent are DoD eligible. In this Market, the total enrolled VA population is less than 20% of the total eligible Veterans population. For the DoD, enrollment data actually exceeds DoD eligible data in select beneficiary cohorts, particularly among active duty family members.

The combined number of DoD/VA unique users of either the direct or indirect⁵⁵ care system (net of dual users) was equal to 81% of the combined enrolled population. The number of unique DoD users of either direct or indirect care was equal to 91% of the number of DoD enrolled. The number of unique VA users was equal to 69% of the VA enrolled. For direct care, 9% of users were dual users (who used both systems).

Service Demand Workloads

Residents of the Puget Sound Market area consumed approximately 23,750 admissions and 117,000 inpatient days of *direct* care in Medicine (including Rehab), Surgery, Behavioral Health (including Substance Abuse), and OB/Newborn. Users in the Puget Sound Market also generated 635 direct Extended Care admissions and approximately 72,000 Extended Care days. In addition, they generated more than 1.7 million direct care outpatient visits. This outpatient activity includes visits to providers, diagnostic departments (such as Radiology), therapeutic departments (such as Physical Therapy), and emergency departments. These data include out-migration (to providers outside of the Market).

The case mix for DoD and VA are quite different. Of the VA’s patient days, 43% were for Behavioral Health and 45% for Medicine. This compares to only 3% and 38% respectively for the DoD. Of the DoD’s inpatient direct care days, 26% were Surgery—compared to only 13% for VA. Seattle VAMC manages 47% of the total Puget Sound Market area patient days and Madigan manages 34%. More than 2,400 of Madigan’s days and more than 18,000 of the Seattle VA’s days originated from outside the Puget Sound Market.

In 2002, more than 50% of the total outpatient workload (including diagnostics and therapeutics) seen at the facilities in this Market was in the Clinical Service Lines of Internal Medicine, Family Practice, Mental Health, and Rehabilitation. As would be expected, Seattle VAMC and

⁵⁵ Indirect care is defined as purchased care in the DoD, and fee-basis care in the VA.

Madigan (combined) provided about two-thirds of the outpatient care in the Market.

Users in this Market also consumed nearly 350,000 indirect care outpatient visits. Eighty-five percent of this activity came from the DoD. Users also consumed nearly 9,000 indirect care admissions, 97% of which were DoD.

Resource Supply and Capacity

Most of the major hospital buildings in the Puget Sound Market were built more than 20 years ago—and many were built more than 50 years ago. However, some of the DoD clinics are very new. In a cursory review of the clinical spaces, the architects scored the inpatient units and ambulatory clinics as either Green or Amber for size and configuration, (on a Red/Amber/Green scale, with Green being the best). However, they observed that most spaces are not ADA compliant. See *Appendix A* for more detail on the facility reviews.

Since both the DoD and VA use 85% inpatient bed occupancy as a planning standard for Medical/Surgical beds, and 65% occupancy is a commonly accepted high level Critical Care planning standard, Mitretek did an initial assessment of Medical/Surgical, Psychiatry, and Critical Care bed capacity versus demand using these standards. The Market has 398 staffed beds and 415 available beds in these categories. In 2002, the Puget Sound Market had a weighted-average staffed-bed occupancy of 64%. (80-85% occupancy—not 100%—is a practical planning standard.) This figure is reduced by very low occupancies at the Naval Hospital Oak Harbor, the Naval Hospital Bremerton, and the Medical/Surgical unit at VA American Lake (which will transfer to Madigan in '04).

Mitretek also completed an analysis of Primary Care capacity and demand; that example is described in *Section 3.2.3*.

Current Market Performance

Cost

The total baseline system-wide cost required to fund the care provided to the beneficiary population in the Puget Sound Market includes annual costs associated with both direct and indirect care. Summing the FY02 cost data for each of these components provides the total annual baseline costs for the Puget Sound Combined Beneficiary population. The current baseline cost performance for the Puget Sound Market is illustrated in the table that follows.

Section 3.0 – MARKET ASSESSMENT FINDINGS & RECOMMENDATIONS

Table 6: Baseline Total Annual Cost of Care to DoD & VA Beneficiaries in Puget Sound Market

Cost Figures in Thousands ('000s)	PUGET SOUND COSTS BY AGENCY		
	DoD	VA	Total
In-Market Direct Care Provided			
Inpatient Care	100,393	106,149	206,542
Outpatient Care	212,183	188,651	400,834
Total In-Market	312,576	294,801	\$ 607,377
Out-Migration (Direct Care Provided Outside Market)			
Inpatient Care	2,000	6,075	8,075
Outpatient Care	5,798	2,620	8,418
Total Out-Migration	7,798	8,694	\$ 16,492
Non-Direct Care (Purchased/Fee Basis Care)			
Inpatient Care	18,958	679	19,637
Outpatient Care	111,120	2,022	113,142

Total Costs per Enrollee and per User (Population and Per Capita Cost Figures are NOT in Thousands)			
Total Enrollees (1)	312,206	87,073	399,279
Total Cost per Enrollee	\$ 1,443	\$ 3,517	\$ 1,895
Total Market Users (1)	290,283	69,858	360,141
Total Cost per User	\$ 1,552	\$ 4,383	\$ 2,101

(1) Market enrollees and market users for FY2002 extracted from the Joint Assessment Study Series 4 Database

Access

Nearly 90% of DoD enrolled and 70% of the VA enrolled beneficiaries are within 30-minute drives of some facility within their respective Systems. More than 97% of DoD and more than 83% of VA live within a 60-minute drive. In all Submarkets except Seattle, 88% or more of the DoD enrollees are within 30 minutes of a DoD facility. In the Seattle Submarket, only 62% of DoD enrollees are within 30 minutes, but 96% are within 60 minutes. The VA has the opposite profile: only in the Seattle Submarket are 90% of the VA enrollees within 30 minutes of any VA facility. The percent within 30 minutes drops to 75% in the South, 57% in the West Sound, and only 38% in the North Sound. In the North Sound, only 55% of VA enrollees are even within 60 minutes of any VA facility. Given that there are DoD facilities in the North Sound and West Sound Submarkets (NH Oak Harbor, BMC Everett, NH Bremerton) and that there are VA facilities in the Seattle Submarket (VAMC Seattle, Shoreline Clinic), opening access to each other's beneficiaries will improve the access for residents of these Submarkets.

A more detailed description of Primary Care access is presented in *Section 3.2.3*.

3.2.2 Options for Sharing/Collaboration Identified

There is a long list of potential ways to share access points in this Market. Some of them involve small shifts of volume, while others require more systematic change. These options are detailed in *Appendix A – Attachment 1*. Overall, there is an opportunity to improve access for the Veterans while providing a richer case mix of patients for the DoD. At the highest level there appears to be opportunity to rationalize and realign primary, specialty, and inpatient care.

3.2.3 Findings from the Application of the Study Methodology to the Opportunity to Rationalize Primary Care

Baseline Situation

Market Demand for Primary Care Services

Mitretek obtained data on primary care visits to Puget Sound facilities from the outpatient direct care standard data files maintained by VA and DoD. They summarized the detailed visit data into an overall estimate of total workload, using one Product Line (PL) for Primary Care, and including four Clinical Service Lines (CSL): Family Practice, Internal Medicine, Pediatrics, and Women’s Health. DoD facilities (as a whole) have workloads in each Clinical Service Line, although Family Practice and Pediatric workloads occur only in DoD facilities. DoD and VA share the Internal Medicine workloads, and VA dominates in Women’s Health.

Supply and Capacity

To estimate the available capacity to provide primary care services at each facility, Mitretek applied an analytic approach incorporating “capacity conversion factors” to the supply of primary care FTE providers at each facility. While the estimated total capacity of a facility, expressed in visits, included Pediatric provider FTEs, Pediatric volumes and capacity were not included in the impact analysis. The VA has no current capacity in Pediatrics, and shifting this volume from DoD to VA facilities was not considered practical.

The table below reflects the initial comparison of the baseline values for both primary care visit workload and primary care capacity at each facility in the Puget Sound Market.

Table 7: Baseline Primary Care Capacity in Puget Sound

Submarket	Facility	Baseline PC Workload (Visits)	Net Capacity Available/ (Needed)	Current PC Capacity (Visits)
North Sound	NH Oak Harbor	50,774	7,329	58,103
	NMCL Everett	17,300	1,871	19,171
Seattle	Seattle VAMC	98,330	24,135	122,465
South	62nd MG-McChord	33,000	1,823	34,823
	American Lake	80,994	(8,514)	72,480
	Madigan (Adjusted)	264,046	20,425	284,471
West Sound	Bremerton CBOC	4,190	4,990	9,180
	BMC Subbase Bangor	20,352	(1,617)	18,735
	NH Bremerton	76,982	39,985	116,967
Total		645,968	90,428	736,396

Access

Both DoD and VA use the same performance standard for geographic access to primary care services. Access is considered acceptable if primary care services are located within a 30-minute drive-time distance from a beneficiary’s residence. Because specific address information was not available in the data, Mitretek used ZIP-code centroid as a proxy for location of residence, and conducted drive-time analyses using GIS software. The drive-time analyses identified the proportion of the current in-Market primary care visit workload that met the 30-minute standard. These proportions, expressed as a percent, establish the access performance baseline for each Submarket and the Puget Sound Market as a whole. The access performance baseline is shown in the table below.¹⁵

Table 8: Access Performance Baseline for Puget Sound

Submarket	In-Market PC Volume		Volume Meeting Access Standard		% Volume Meeting Access Standard		
	DoD	VA	DoD	VA	DoD	VA	Comb'd
North Sound	66,010	19,808	58,177	5,492	88.1%	27.7%	74.2%
Seattle	8,324	56,800	4,263	50,805	51.2%	89.4%	84.6%
South	286,218	80,287	257,444	52,190	89.9%	65.0%	84.5%
West Sound	97,857	20,646	89,357	3,080	91.3%	14.9%	78.0%
Total Market	458,409	177,541	409,241	111,567	89.3%	62.8%	81.9%

Cost

The total costs incurred by both DoD and VA to provide primary care to the in-market beneficiaries in FY02 represents the baseline cost performance for this analysis. This cost analysis identified those costs

¹⁵ The visit volumes shown in Tables 8 & 9, while correct for the Market as a whole, differ from the Submarket totals in Tables 7 and 10. This is because Tables 8 & 9 reflect patient origin, rather than facility location, as the basis for the Submarket designation.

associated with the current in-Market primary care visit workload reflected in the access performance table above. The cost performance baseline is shown in the table below.

Table 9: Cost Performance Baseline for Primary Care in Puget Sound

Submarket	In-Market Primary Care Volume		In-Market Primary Care Costs		Average Total Cost per Visit		
	DoD	VA	DoD	VA	DoD	VA (1)	Combined
North Sound	66,010	19,808	\$9,998,000	\$3,045,000	\$ 151	\$ 154	\$ 152
Seattle	8,324	56,800	\$1,448,000	\$8,733,000	\$ 174	\$ 154	\$ 156
South	286,218	80,287	\$46,940,000	\$12,344,000	\$ 164	\$ 154	\$ 162
West Sound	97,857	20,646	\$21,546,000	\$3,174,000	\$ 220	\$ 154	\$ 209
Total Market	458,409	177,541	79,932	27,297	\$ 174	\$ 154	\$ 169

Impact of Primary Care Rationalization

Analytical Approach

Mitretek rationalized primary care in the Puget Sound Market by applying three analytical steps to the baseline data. These steps are briefly described below.

Step 1 – Rationalize Access. Rationalizing access is accomplished by opening the facilities of each system to the beneficiaries of the other. The primary care visit workload that is affected by this change is generated from ZIP codes (and counties) that are closer to the newly-opened facility than the facility where this workload was previously accommodated. During the site visits, staff at both VA and DoD facilities reported that some beneficiaries of the “other” system were driving past their facilities to receive services from more distant locations.

This step moves these primary care volumes to the nearest facility *with available capacity*, either DoD or VA, in three Clinical Service Lines: Family Practice, Internal Medicine, and Women’s Health. The VA has no capability to provide Pediatric services, so these workload volumes remain at DoD facilities. Additionally, no workload is shifted from VA to DoD “sick call” facilities (e.g., TMC #1 – Ft. Lewis). These actions result in some workload moving from DoD facilities to VA facilities, from VA facilities to DoD facilities, and within DoD or VA, if a different facility is closer than the one currently providing primary care services.

Step 2 – Rationalize Resources. The objective of Step 2 is to shift or reallocate volumes and resources among facilities—maintaining the performance against the 30-minute access standard achieved above—to achieve better operating efficiencies at these facilities, and reduce or eliminate the extent to which any facility is “overstretched.”

Step 3 – Rationalize Access Points. The objective of Step 3 is to continue to improve the overall performance of the delivery system in the Puget Sound Market compared to the access standard by opening new primary care access points. During its site visit, Mitretek learned that the VA was assessing the potential of opening several Community-Based Outpatient Clinics (CBOCs) in the Market, in areas that had relatively significant numbers of veteran users residing outside the access standards. In this example, Step 3 assumes that all three of these CBOCs will be opened.

Results

The results of applying this three-step approach are shown in the table below.

Table 10: Puget Sound Primary Care Demand and Supply – Impact of Rationalization

Submarket	Facility	Baseline PC Visits Required	Step 3 Change	Step 3 PC Visits Required	Net Capacity Available/ (Needed)	PC Visit Capacity	Step 3 Capacity Changes
North Sound	NH Oak Harbor	58,654	(2,505)	56,149	1,954	58,103	
	BMC Everett	17,300		17,300	1,871	19,171	
	Bellingham CBOC		2,505	2,505	0	2,505	2,505
Seattle	Seattle VAMC	96,375		96,375	23,585	119,960	(2,505)
South	62d MG-McChord	32,179		32,179	2,644	34,823	
	American Lake	75,092	(16,193)	58,899	6,568	65,467	(16,193)
	Centralia CBOC		6,433	6,433	0	6,433	6,433
	<u>Olympia CBOC</u>		9,760	9,760	0	9,760	9,760
	Madigan	257,389		257,389	27,082	284,471	
West Sound	Bremerton OEC	0		0	(0)	(0)	
	BMC Subbase Bangor	20,352		20,352	(1,617)	18,735	
	NH Bremerton	88,627		88,627	28,340	116,967	
Total Market		645,968	0	645,968	90,428	736,396	0

Mitretek finds that, based on this example, access performance can be improved significantly by opening new access points and redistributing capacity from facilities with surplus capacity. This is true even intra-VA or intra-DoD, if rationalizing access through policy action cannot be accomplished.

Opening three new VA CBOCs in Bellingham, Centralia, and Olympia improves VA-only Market performance from a baseline of 62.8% to 70.7%. Opening new VA primary care access points, and changing policy to permit access to the closest facility regardless of System, increases overall Market-wide access performance to 97.2%, a significant improvement over the 62.8% baseline.

Cost Impact of the Rationalization

For this analysis of the opportunity to rationalize primary care in the Puget Sound Market, the baseline costs to provide primary care to the in-market

Section 3.0 – MARKET ASSESSMENT FINDINGS & RECOMMENDATIONS

beneficiaries incurred by both DoD and VA in FY02 were established as the baseline cost performance for the system under status quo operations. Assuming the implementation of these three sequential steps to rationalize primary care in the market, Mitretek projected the expected incremental operating cost impact on each facility that shows a measurable improvement in access.

With the primary care service data that are available in the Study database, the FY02 Puget Sound facility-specific operating costs—both the average total cost per visit and the variable cost per visit—can be calculated and identified with the specific patient volumes being redistributed. In the cost analysis of this opportunity to rationalize primary care, no assumptions were made as to the ability of the two Systems to take advantage of any of the excess provider capacity that might exist and could be leveraged to achieve greater productivity in any of the current service locations. The cost impact illustrated in the table below assumes that the full average variable cost associated with the current visits by location will be redistributed with the visit volumes.

The results of applying this variable cost impact analysis to the three-step redistribution of primary care visit workloads to improve access are shown in the table below.

Table 11: Puget Sound Primary Care – Cost Impact of Rationalization

Submarket	Facility	Net Volume Changes by Facility			Incremental Cost Impact of Redistribution of Visits			
		Baseline PC Visits	Net PC Visit Change After Step 3	Total PC Visits After Step 3	Baseline PC Costs (\$ in thousands)	Baseline Average Variable Cost/Visit (\$)	Cost After Step 3 Changes (\$ in thousands)	Step 3 Cost Changes
North Sound	NH OAK HARBOR	50,774	5,375	56,149	\$ 7,690,246	\$ 123	\$ 8,278,250	\$ 588,004
	NMCL EVERETT	17,300	0	17,300	\$ 3,338,666	\$ 155	\$ 3,338,666	\$ -

Seattle	Seattle	98,330	-1,955	96,375	\$ 15,147,833	\$ 116	\$ 14,921,956	\$ (225,877)
South	62nd MED GRP-MCCHORD	33,000	-821	32,179	\$ 6,754,010	\$ 168	\$ 6,616,033	\$ (137,977)
	American Lake	80,994	-22,095	58,899	\$ 11,813,907	\$ 109	\$ 9,396,799	\$ (2,417,108)
	Centralia CBOC (2)	0	6,433	6,433	\$ -	\$ -	\$ 863,889	\$ 863,889
	Olympia CBOC (2)	0	9,760	9,760	\$ -	\$ -	\$ 1,088,558	\$ 1,088,558
	MADIGAN AMC (Adjusted)	264,046	-6,657	257,389	\$ 42,242,079	\$ 129	\$ 41,380,996	\$ (861,083)
West Sound	Bremerton OC (3)	4,190	-4,190	0	\$ 1,247,845	\$ 223	\$ 311,961	\$ (935,884)
	BRMCL SUBASE BANGOR	20,352	0	20,352	\$ 3,872,945	\$ 153	\$ 3,872,945	\$ -
	NH BREMERTON	76,982	11,645	88,627	\$ 16,949,750	\$ 178	\$ 18,701,182	\$ 1,751,432
Total Market		645,968	0	645,968	\$ 109,057,282	\$ 134	\$ 109,057,282	\$ (0)

(1) Variable costs per visit from DoD from SADR patient record level cost data; VA average variable cost estimated at 75% of total for this analysis. In this analysis, the full variable cost of the visit at the originating facility is assumed to move with the patient to the new facility. No potential efficiencies from increased utilization of any excess capacity in the system are assumed in this analysis.
(2) Transition costs to develop these new access points are not included in this illustration of operational cost impact of the redistribution of care
(3) Reduction in fixed expenses achievable with the redistribution of Bremerton volumes are not included in this illustration of operational cost impact

3.2.4 Findings from the Assessment Applying the Collaboration Framework

According to the 2002 DoD/VA Sharing Database, there were six master sharing agreements between the VA Puget Sound Health Care System and the military facilities in the region, covering a wide range of clinical and administrative activities. The primary focus of VA and DoD planning during the past year has been the impending initiative to move inpatient Medical/Surgical patients from VA American Lake to Madigan. Local officials regard this as a significant sharing accomplishment.

During the second site visit, both the quantitative methods used (rationalization of primary care example) and the Collaboration Framework were reviewed. Mitretek also presented and facilitated discussion about more than 50 opportunities for increased DoD/VA collaboration in the Market. These opportunities included ideas that were applicable to all Markets (grouped into the Collaboration Framework) as well as ideas specific to the Puget Sound Market and/or specific to certain facilities in the Market. *Appendix B - Attachment 1* provides detail about these opportunities.

One of the tools in the Collaboration Framework is a Relationship Grid. Along a continuum of Separate→Coordinated→Connected→Integrated→Consolidated, most of the relationships among the major hospitals in the Market are either Separate or Coordinated. In terms of clinical workload, VA and Madigan are considered Coordinated because there is regular communication between the two hospitals. However, Mitretek found the relationships between the VA and the two Naval Hospitals (Bremerton and Oak Harbor) to be less well-developed (rated as Separate) due to the low volume of referrals between them. In terms of Staffing, VA and Madigan are also considered Coordinated since there is some sharing where duplication exists and some cross-staffing support to balance peak workloads. In terms of Facilities, all of the hospitals are currently rated as Separate since they are distant from each other and cannot share physical space; this reinforces the idea of distributing primary care volumes among the facilities of each System. VA and Madigan also work together more closely than VA and the Naval Hospitals in other domains; they are Coordinated in Information Management/Information Technology, Governance and Logistics.

Feedback during the second site visit affirmed the Collaboration Framework as a useful tool for looking at the relationship between VA and DoD within a market. The framework highlights the many dimensions of collaboration, and can be used as a frame of reference in future planning.

3.2.5 Recommendations for the Puget Sound Market

The opportunity to rationalize primary care analyzed in the application of this Study Methodology provides a basis for some relatively stable recommendations that can be used as a basis for future planning in the Puget Sound Market (and potentially elsewhere).

Mitretek recommends that the VA and DoD continue to move forward with their planning efforts to open new primary care access points in geographic areas that are currently underserved.

The analysis in this Report, based on the quantitative workload and capacity information available from both systems, provides a useful “scorecard” and a relatively comprehensive approach for identifying and analyzing care delivery issues in the Market, especially—but not limited to—those involving sharing and collaboration between VA and DoD. In the site visits, Mitretek observed that while both systems were considering many collaboration issues and initiatives, these discussions often occurred without an understanding of the overall range and depth of care delivery in the Market. That is, there was often a lack of context for framing the potential improvement represented by a particular initiative, no method to evaluate it, and no consistent method for comparing it to other, equally intriguing ideas. Mitretek believes that the comprehensive, data-driven, Market-wide perspective used in the methods and analysis described in this Report represents a significant contribution to DoD and VA joint planning efforts, for primary care and other categories of health care services.

Mitretek recommends that the VA and DoD use the Collaboration Framework to assist the organizations as they consider, plan for, and act on most of the identified opportunities.

These opportunities represent the present avenues for improving care delivery to military and veteran beneficiaries residing in the Market. All such actions should proceed from a deliberate joint planning process.

3.3 Gulf Coast

3.3.1 Market Overview

The table below identifies the Submarkets, counties, and facilities in the Gulf Coast Study Market. (A reference map is available in *Appendix A, Section 3.*)

Table 12: Study Market Area Definition for Gulf Coast

Submarket	County	DoD Facilities	VA Facilities
Biloxi/Gulfport	George Greene Hancock Harrison Jackson Pearl River Stone	- Keesler Medical Center - BMC Pascagoula - BMC Gulfport	VA Gulf Coast Veterans Health Care System: - VA Biloxi Division - VA Gulfport Division
Mobile	Baldwin Mobile Washington, AL		- Mobile CBOC
Eglin	Okaloosa Walton	- Eglin AF Hospital - 16 th MG, Hurlburt Field	
Panama City	Bay Holmes Washington, FL	- BMC Panama City - Tyndall AFB	- Panama City CBOC
Pensacola	Escambia, AL Escambia, FL Santa Rosa	- NH Pensacola - NTTC Corry Station - NATTC Pensacola - NAS Pensacola Clinic - BMC Whiting Field	- Pensacola CBOC

The Gulf Coast Market Area is unique in that it encompasses a very large geographic area, some parts of which are sparsely populated. The geography is also dominated by the Gulf of Mexico—resulting in a 250-mile linear distance between the two ends of the Market. Further, the area (particularly Florida) is a popular location for DoD retirees; thus, there are a high number of “dual eligibles”.

The topography of the Market makes providing adequate access to care difficult. Since the Market area is so large and long, determining whether or not to provide services (particularly inpatient services) in a specific location is a challenge. In many individual locations (especially east of Biloxi/Gulfport), each System has a population that is important to serve—but there may not be sufficient population to warrant an individual hospital for each System. At the same time, there are two major hospital facilities adjacent to each other in Biloxi, MS—with a third nearby in Gulfport. In the eastern Submarkets, where the only inpatient facilities are DoD, and in the Mobile Submarket where there is only a VA outpatient center, access to each other’s facilities has the potential to improve access for beneficiaries. In the Biloxi/Gulfport Submarket, where there are three inpatient hospitals—all with significant capital requirements—an opportunity exists to simultaneously reduce long-term capital costs and to enrich the Graduate Medical

Education (GME) experience by “opening” access and combining some of the services of these facilities. An example analysis that demonstrates the impact of rationalizing access to inpatient care follows in *Section 3.3.3*.

Beneficiary Populations

The Gulf Coast Market Area has approximately 509,000 eligible Combined Beneficiaries—approximately 55,000 of whom are “dual eligible”. The eligible population is fairly evenly split between DoD and VA. The overall enrolled population is equal to 70% of the eligible population. Specifically, the enrolled Veterans equaled 25% of eligible Veterans, while the number of DoD enrolled exceeds the number of eligibles on average for the whole Market (but it is equal to less than 25% of the eligible population in some specific counties).

The number of unique users of either the direct or indirect care system equaled 92% of the enrolled population (net of dual users). The number of DoD users of either direct or indirect care was similar to the number of DoD enrolled in 2002, while the number of unique VA users was equal to 77% of the VA enrolled population. For *direct* care, 7% of users were dual users (beneficiaries who used both systems).

Service Demand Workloads

In 2002, residents of the Gulf Coast Market generated about 17,850 admissions and 93,200 inpatient days of direct care in Medicine (including Rehab), Surgery, Behavioral Health (including Substance Abuse), and Obstetrics/Newborn (Post Partum and Nursery days both counted). In addition, the users in the Gulf Coast Market generated approximately 540 direct Extended Care admissions and approximately 76,000 Extended Care days.

The case mixes for DoD and VA are quite different—especially for Behavioral Health and Surgery: 47% of the VA’s patient days were for Behavioral Health and 10% were for Surgery. This compares to 3% BH and 30% Surgery for the DoD.

For outpatient workload, residents of the Gulf Coast Market generated more than 1.4 million direct care visits. This outpatient activity includes visits to providers, diagnostics departments (such as radiology), therapeutic departments (such as physical therapy), and emergency departments, and includes out-migration. From the perspective of the facilities (rather than the Market), about 57% of total Combined Beneficiary workload (provider, diagnostic, and therapeutic activity combined) was in the Clinical Service Lines of Internal Medicine, Family Practice, Mental Health, and Rehabilitation.

Users in this Market also produced more than 715,000 indirect care (purchased and fee-based) outpatient visits. This volume is nearly twice that of the whole Puget Sound Market, and 95% of the volume is DoD

volume. One-third of the DoD volume was for people over the age of 65 (presumably TRICARE for Life¹⁶ users) and two-thirds was for people over the age of 45. Users in this Market also generated more than 15,600 indirect care admissions, nearly 99% of which were DoD. The DoD indirect care use rates per 1,000 enrollees in the Gulf Coast for both outpatient and inpatient care were twice that of the other Study Markets.

Resource Supply and Capacity

Most of the major hospital buildings were built more than 20 years ago—and some were built more than 50 years ago. A cursory review of the clinical spaces by architects shows a mix of functionality in the inpatient units and ambulatory clinics. Many of the inpatient units score as either Green or Amber for size and configuration (on a Red/Amber/Green scale—with Green being the best). However, quite a few spaces received Red scores, including size and configuration of the Critical Care units at VAMC Biloxi; size and configuration of the Medical/Surgical inpatient units at Eglin, NH Pensacola, and VA Gulfport; and configuration of several clinics at Keesler. In addition, the architects noted that most spaces are not ADA compliant. The Engineers rated the major buildings at Tyndall, VAMC Biloxi, and Whiting Field as Fair. The condition of BMC Panama City was rated as Poor. See *Appendix A-Attachment 9* for more detailed facility reviews.

Since both the DoD and VA use 85% inpatient bed occupancy as a planning standard for Medical/Surgical beds, and 65% occupancy is a commonly accepted high level Critical Care standard, this Study uses these standards in an initial assessment of Medical/Surgical, Psychiatry, and Critical Care bed capacity versus demand. The Market has 281 staffed beds and 344 available beds in these categories. In FY02, the Gulf Coast Market had a weighted average, staffed-bed occupancy of 59% (note that the target occupancy is usually 80-85%, not 100%).

Current Market Performance

Cost

The total baseline system-wide cost required to fund the care provided to the beneficiary population in the Gulf Coast Market includes annual costs associated with both direct and indirect care. Totaling the FY02 cost data for each of these components of care delivery provides an annual baseline cost for the Gulf Coast Combined Beneficiary population. The current baseline cost performance for the Gulf Coast Market is illustrated in the table below.

¹⁶ **TRICARE For Life (TFL):** New benefits (October 1, 2001) for Medicare-eligible uniformed service retirees (and Medicare-eligible family members). TRICARE is a secondary payer to Medicare.

Table 13: Baseline Total Annual Cost of Care to DoD & VA Beneficiaries in Gulf Coast Market

Cost Figures in Thousands ('000s)	GULF COAST COSTS BY AGENCY		
	DoD	VA	Total
In-Market Direct Care Provided			
Inpatient Care	72,792	50,031	122,823
Outpatient Care	205,912	104,729	310,641
Total In-Market	278,704	154,761	\$ 433,465
Out-Migration (Direct Care Provided Outside Market)			
Inpatient Care	3,071	14,832	17,903
Outpatient Care	8,824	6,063	14,887
Total Out-Migration	11,895	20,896	\$ 32,791
Non-Direct Care (Purchased/Fee Basis Care)			
Inpatient Care	36,534	968	37,502
Outpatient Care	141,064	1,550	142,614
Total Non-Direct	177,598	2,518	\$ 180,116
Total Delivery Costs			
Inpatient Care	112,397	65,832	178,229
Outpatient Care	355,800	112,343	468,143
TOTAL	468,197	178,175	\$ 646,372

Total Market Users (1)	368,157	61,545	429,702
Total Cost per User	\$ 1,272	\$ 2,895	\$ 1,504

(1) Market enrollees and market users for FY2002 extracted from the Joint Assessment Study Series 4 Database

Access

Nearly 95% of DoD enrolled and 71% of the VA enrolled beneficiaries are within a 30-minute drive of some facility within their respective Systems. Opening access so that VA and DoD beneficiaries can obtain primary care services at any VA or DoD facility dramatically improves the percent of visits that would meet the 30-minute drive time standard—especially for the VA. With *current* practices, only 67% of VA primary care visits were within 30 minutes of any VA facility; the percent within standard ranges from a low of 0% in the Eglin Submarket to a high of 83% in the Pensacola Submarket. For DoD, 93% of primary care visits in the entire Market were within a 30-minute drive of a DoD facility. The percent within standard is 90% or greater in all Submarkets except Mobile, in which only 46% of DoD primary care visits originated from ZIP codes within 30 minutes' drive of a DoD facility.

By allowing Combined Beneficiaries to go to the nearest VA or DoD facility for primary care, the percent of VA visits within 30 minutes of any facility increases to 95% or better in all Submarkets. For the DoD,

opening access to the Mobile CBOC would increase the number of visits within 30 minutes from 46% of total to 79% for the beneficiaries living in the Mobile Submarket.

None of the roughly 900 VA inpatient admissions that originated from VA beneficiaries outside of the Biloxi/Gulfport Submarket were within a 60-minute drive to any VA inpatient facility. For DoD, more than 90% of admissions were within a 60-minute drive of a DoD inpatient facility in all Submarkets except for Mobile (80% within 60 minutes) and Panama City (only 8% within 60 minutes). These overall statistics could be improved if the DoD allowed Veterans to receive care in DoD facilities.

3.3.2 Options for Sharing/Collaboration Identified

There is a long list of potential sharing opportunities in this Market; some of them involve small shifts of volume, while others require much more systematic change. These options are listed in detail in *Appendix A – Attachment 6*. Overall, there is an opportunity to improve access for the Veterans while providing a richer case mix of patients for the DoD. At the highest level there appears to be opportunity to rationalize and realign primary, specialty, and inpatient care.

3.3.3 Findings from the Application of the Study Methodology to the Opportunity to Consolidate Inpatient Care in Biloxi/Gulfport

Overview

This subsection provides the results of an analysis that examined the opportunity to consolidate inpatient care (Medical/Surgical care, including Critical Care) in the Biloxi/Gulfport Submarket. Two scenarios are provided to demonstrate the capacity impact and economic implications of centralizing care at Keesler Medical Center (Scenario A) or at VAMC Biloxi (Scenario B). Also embedded in this analysis are assumptions about opening or expanding VA access to Eglin Hospital and NH Pensacola in the Florida Submarkets.

Of the 48 health care facilities included in this Study (in all three Markets), Keesler and VAMC Biloxi are the only two health care facilities that offer a similar mix of inpatient services from each System side-by-side (separated by only a few hundred yards). In an era when DoD/VA sharing has become a key initiative for the Federal government, Mitretek is certainly not the first to inquire about the possibility of consolidation, given the close proximity of these two hospitals. In July, for example, members of the VA CARES Commission paid a visit to the VA Biloxi and Gulfport Divisions as well as to Keesler Medical Center and met with VA and DoD leadership, including the commanding General. The site visit notes raise several points associated with opportunities for increased collaboration between VAMC Biloxi and Keesler, including one future delivery model option in which Keesler would “take care of inpatient

services while VA would take care of outpatient services.”¹⁷ One month later, in a CARES Commission Post Hearing Summary for VISN 16, the Commissioners recommended that an “additional study needs to be undertaken to assess the cost/benefit of the options available at VA Biloxi, including partnership with Keesler.”¹⁸ The application of this Study’s methodology takes the next step—exploring this opportunity based on the current performance of these two Federal assets.

Baseline Situation

Demand for Inpatient Services

Demand for this analysis focuses on Medical/Surgical and Critical Care inpatient utilization by beneficiaries who reside in the Gulf Coast Market. The table below shows the total discharges and average lengths of stay for in-market consumption, out-migration (to other Federal providers) and indirect care (by private network providers). The FY02 volume in this exhibit excludes Mental Health, Rehabilitation, Extended Care, and Obstetrics/Newborns. A full profile of inpatient and outpatient care demand in the Gulf Coast can be found in *Appendix A*.

Table 14: Total Utilization of Inpatient Medical/Surgical Care by Gulf Coast Beneficiaries

Submarket	In-Market (a)			Out-Migration (b)			Non-Direct Care (c)			Total
	DoD	VA	Total	DoD	VA	Total	DoD	VA	Total	
Biloxi/Gulfport	2,869	1,289	4,158	72	261	333	2,209	18	2,227	6,718
Eglin	2,722	65	2,787	97	59	156	3,642	14	3,656	6,599
Mobile	249	245	494	23	185	208	1,816	55	1,871	2,493
Panama City	42	41	83	22	66	88	2,784	34	2,818	2,989
Pensacola	2,379	138	2,517	122	188	310	3,886	41	3,967	6,714
Total Discharges	8,261	1,778	10,039	336	599	935	14,337	202	14,539	25,513
ALOS	4.53	7.12	4.99	4.15	7.12	6.05	6.82	4.11	6.78	6.05

(a) Utilization by resides of each submarket at federal facilities in the Gulf Coast.
 (b) Beneficiaries living in the Gulf Coast receiving care by a federal provider outside the Market.
 (c) Services provided by non-federal providers through fee-basis care (VA) and purchased care (DoD).

The in-market volume above reflects care provided by the four facilities offering Medical/Surgical care in the Gulf Coast (excluding Gulfport) to beneficiaries who reside in this Market. Of the 14,337 DoD indirect care discharges, over half represent patients 65 years of age or older (mostly TRICARE For Life enrollees). If patients over 65 are excluded from DoD indirect care, 57% of the remaining inpatient demand (including direct care) is accommodated by DoD and VA hospitals in the Gulf Coast.

With respect to the Biloxi/Gulfport Submarket, roughly 71% (or 2,048) of the 2,869 DoD in-market discharges were generated by retirees and their

¹⁷ CARES Commission Site Visit Report, page 2; Visit: July 2, 2003; Prepared by K. Collier, July 14, 2003

¹⁸ CARES Commission Post Hearing Summary, Section V., page 4; August 26, 2003

family members. Not surprisingly, nearly all of this care was provided at Keesler (11 total discharges at Eglin and NH Pensacola combined). Similarly, nearly all of the 1,289 VA in-market direct discharges took place at VAMC Biloxi. In terms of VA out-migration, 185 of the 261 discharges occurred at the VA Medical Center in New Orleans, which is the VA's tertiary care hospital serving the Gulf Coast Market and Southeast Louisiana.

Supply

The five inpatient facilities in the Gulf Coast Market include two in the eastern end of the Market, and three hospitals in the Biloxi/Gulfport Submarket. These facilities are:

- Eglin Hospital (96th Medical Group at Eglin AFB) (a.k.a. Eglin)
- Naval Hospital Pensacola (NH Pensacola)
- Keesler Medical Center (81st Medical Group at Keesler AFB) (a.k.a. Keesler)
- VA Gulf Coast Veterans Health Care System – Biloxi Division (VAMC Biloxi)
- VA Gulf Coast Veterans Health Care System – Gulfport Division (VA Gulfport)

Eglin and NH Pensacola are located approximately 50 miles apart in the Eglin and Pensacola Submarkets. Each facility caters primarily to the needs of the active duty and their family members in their separate and distinct service areas (centered by Eglin AFB and Naval Air Base Pensacola, respectively). The facilities are similar in terms of their size, service mix, and volume.

Eglin is a 65-bed hospital (available beds) which had an average daily census of 28 in FY02. Roughly 44% of its total workload (5,000 discharges) was Obstetrics/Newborn. In terms of Medical/Surgical care, Eglin has available capacity of 55% (7,285 bed days), with an occupancy target of 85% for Medical/Surgical and 65% for Critical Care.

NH Pensacola, located west of Eglin, is a 60-bed facility with an average daily census of 25; 37% of its total discharges (3,600) in FY02 were attributed to Obstetrics/Newborn. The hospital currently has a sharing agreement with the VA for inpatient care, and because demand by the veterans/retirees is steadily increasing, there are plans to reevaluate the agreement to allow greater VA access. In FY02, VA enrollees accounted for 87 discharges (according to a patient classification field in the DoD national data). Its current workload levels suggest that NH Pensacola has available capacity of 82% (10,193 bed days) for Medical/Surgical care (with an 85% occupancy target).

The Gulfport Division of the VA Gulf Coast Veterans Health Care System (GCVHCS) provides inpatient and outpatient Mental Health services, and houses an Alzheimer's dementia unit. Through a collaborative agreement

with Keesler AFB, VA Gulfport also accommodates the needs of military personnel with acute mental health care needs. This facility was excluded from the Medical/Surgical Scenarios discussed later in this section (it currently has one Medical/Surgical bed), but it plays a vital role in providing behavioral health services to the entire Gulf Coast Market. Its future delivery model and location (currently under review by the VA) will have a direct impact on the other two facilities in Biloxi/Gulfport.

The facilities included in this analysis, VAMC Biloxi and Keesler Medical Center, are located in Biloxi, 8 miles northeast of the Gulfport facility. The VA Biloxi campus includes 37 buildings on approximately 125 acres of land. It is surrounded on the east and west by Keesler AFB housing. VAMC Biloxi serves as the only VA general medical facility for the Gulf Coast Market, with 40 Medical/Surgical beds and 9 Intensive Care beds. Neighboring Keesler is a 90-bed tertiary care center, originally constructed as a 300-bed facility, which currently has a reported 63 Medical/Surgical beds and 22 Intensive Care Unit beds (available beds). The space for the approximately 200 unused beds currently houses outpatient services and administrative functions. The workload, capacity and operating costs for these two facilities are provided in the balance of this section.

Capacity

For purposes of the analysis provided in this section, Medical/Surgical and Critical Care capacity was measured only for VAMC Biloxi and Keesler. An 85% occupancy standard for Medical/Surgical care and 65% occupancy standard for Critical Care was used to measure the Net Maximum Capacity based on available beds. Capacity is measured in a status quo environment with the analytical assumption that each facility is now operating with adequate resources to meet the Medical/Surgical care needs of their respective populations. The following table represents the baseline workload and estimated available capacity for inpatient Medical/Surgical and Critical Care services at Keesler and VAMC Biloxi.

Table 15: Estimated Medical/Surgical Capacity at Keesler and VAMC Biloxi

	Keesler Medical Center			Biloxi VAMC		
	Med/Surg	Critical Care	Total	Med/Surg	Critical Care	Total
Baseline Capacity						
Available Beds Reported	63	22	85	40	9	49
Max Net Capacity (85/65) (a)	19,546	5,220	24,765	12,410	2,135	14,545
Baseline Bed Days (FY02)	10,596	3,761	14,357	12,695	912	13,607
Max Net Occupancy (%)	54%	72%	58%	102%	43%	85%
<hr/>						
Avg Daily Census	29	10	39	35	2	37
Baseline Discharges	3,021	696	3,717	1,757	161	1,918
Avg Length of Stay	3.5	5.4	3.9	7.2	5.7	7.1
<hr/>						
Net Capacity Available (b)						
Estimated Bed Days	8,950	1,459	10,408	(285)	1,223	938
Estimated Discharges	2,552	270	2,822	(39)	216	177
Equivalent Beds	25	4	29	(1)	3	2

(a) Estimated capacity of the available beds (in days) based on 85% target occupancy for med/surg and 65% for critical care.
 (b) Discharges and equivalent beds based on current ALOS.

Based on the number of available beds (85) at Keesler, this would suggest that 25 Medical/Surgical beds and 4 Critical Care beds are available for incremental volume. To the contrary, VAMC Biloxi baseline Medical/Surgical days and available beds suggest the facility has essentially no available capacity with an estimated three critical care beds available (based on the 85% Medical/Surgical and 65% Critical Care occupancy targets). The capacity estimates clarify the simple point that if there was a significant influx of Medical/Surgical volume in Biloxi/Gulfport (or neighboring Submarkets), Keesler would be in a better position to handle the incremental volume (assuming a status quo mode). This reinforces conclusions drawn during the VA CARES process.

As illustrated in the table below, the vast majority of the capacity (shown in bed days) is utilized by patients originating from within the Gulf Coast Market with a moderate amount (8%-9%) of in-migration.

Table 16: Bed Days by Patient Origin at Keesler & VAMC Biloxi

Patient Origin	Keesler	Biloxi
Biloxi/Gulfport	10,618	8,957
Mobile	438	1,968
Pensacola	716	948
Eglin	1,063	445
Panama City	212	216
In-Migration	1,310	1,073
Total M/S & ICU Days	14,357	13,607

The total number of bed days from the three eastern Submarkets to VAMC Biloxi is 1,609 – or 12% of its total. Despite the 3½ to 4½ hours of drive time from these points, this figure still appears relatively low, considering the fact that VAMC Biloxi is the only acute care facility in the Market. From a VA planning standpoint, the true demand from the nearly 135,000 eligible veterans residing in the Florida Panhandle is suppressed to some extent because all the veterans who seek inpatient services are not necessarily emerging in the VA data. At least one-third of this eligible population is over 65 years of age, which means one can assume that a sizeable portion of these veterans are relying on Medicare, although some most likely supplement this with benefits through the DoD TRICARE program (many through the TRICARE for Life plan). An additional 24,000 are retirees (dual eligible) under 65 who may also enroll with TRICARE. According to FY02 TRICARE claims data, private hospitals in the Pensacola area received over 2,000 Medical/Surgical admissions of Combined Beneficiaries 65 years and older who reside in the Pensacola Submarket. An additional 1,500 admissions came from patients originating in the Eglin Submarket. In general, there exists a growing demand in the Florida panhandle from aging veterans who choose not to or cannot travel to Biloxi for care, but would utilize VA inpatient services if a hospital were located in one of the eastern Submarkets. For planning purposes, this makes it difficult to estimate the true level of VA inpatient demand in this Market.

Cost

FY02 operating costs were compiled from several sources for Keesler and VAMC Biloxi to gauge the estimated delivery costs associated with inpatient services, particularly Medical/Surgical care. The purpose of introducing operating costs into this analysis is not to compare operating cost efficiency between the two facilities and/or delivery systems, but to appreciate in the aggregate what different resources are required by the two Systems to offer similar inpatient services to their respective patient populations.

The total combined operating cost of Keesler and VAMC Biloxi is \$300.8M (DoD, \$167.8M; VA \$133M). This includes all health care services provided at the facility as well as other system-specific missions (e.g., Readiness Programs at Keesler). With a focus on inpatient services, the exhibit below provides FY02 operating costs for Keesler and VAMC Biloxi for Medical/Surgical and Critical Care.

Table 17: Total Operating Costs for Inpatient Medical/Surgical Care in Biloxi

FY 2002	Keesler Medical Center (a)			Biloxi VAMC (b)		
	Med/Surg	Critical Care	Total	Med/Surg	Critical Care	Total
Operating Costs (in '000s)						
Variable Cost	17,389	8,382	25,771	15,139	1,343	16,482
Fixed Cost	4,977	2,144	7,121	4,333	344	4,676
Total Cost	\$22,366	\$10,526	\$32,891	\$19,471	\$1,687	\$21,158
Average Cost per (actual \$)						
Discharge	\$7,403	\$15,123	\$8,849	\$11,082	\$10,477	\$11,031
Bed Day	\$2,111	\$2,799	\$2,291	\$1,534	\$1,850	\$1,555

(a) Costs were captured from MEPRS and SADR data. Fixed and variable were estimated at a SEEC code level.
 (b) Cost data was obtained from DSS National Data Extracts. Variable costs were drawn from Account Level Budget Cost Center Detailed Reports.

The amounts shown above are a “preview” of the operating costs associated with this select inpatient volume for each facility. On a per discharge basis, it is not surprising that VA is \$1,000 higher than DoD given the difference in case mix. Similarly, the average cost per day is less for VAMC Biloxi due to the greater average length of stay (double that of Keesler’s). With an average combined operating cost per bed day of about \$1,900, future operating cost savings realized through increased collaboration or consolidation can be viewed as an investment in the future health care needs of the Combined Beneficiaries.

Impact of Realigning Inpatient Services

Analytical Approach

Mitretek assessed the opportunity to consolidate Medical/Surgical care in Biloxi/Gulfport by showing the impact of centralizing this care at Keesler (Scenario A) or at VAMC Biloxi (Scenario B). These scenarios were built on the baseline performance of each facility, their current capacity, and the following key assumptions:

1. *Eastern Submarket Facilities Recapture Medical/Surgical Care.* This assumes that DoD and VA beneficiaries currently residing in the Eglin and Pensacola Submarkets would have access (eligibility) to receive care at the nearest Federal hospital with available capacity, namely NH Pensacola or Eglin (and on the private network if necessary). In the two scenarios, the bed days of care for these beneficiaries were identified and deducted from the baseline for the measurement of capacity at VAMC Biloxi and Keesler. Additionally, bed days of beneficiaries in the Mobile Submarket who have nearly equal access (in drive time), to the Biloxi hospitals and NH Pensacola were

deducted from the baseline at 50% of the total, to adjust for the likelihood of their utilizing Biloxi hospitals.

2. *Practice Patterns Held Constant.* In the scenarios, the Medical/Surgical volume is transferred between these facilities without making adjustments to account for the different ways in which DoD and VA may deliver clinical services. This is accomplished by simply transferring all the bed days from one facility to the other without altering the average lengths of stay (ALOS).
3. *Operating Cost Savings of 10%.* An in-depth cost accounting analysis would be required to measure the potential operating cost savings to be realized by consolidating the Medical/Surgical services of the two facilities. This analysis assumes that operating costs, less 10%, are transferred with the volume. This is a conservative placeholder, given that fixed indirect costs can be as high as 20% on an average per discharge/bed day basis.
4. *Capital Requirements Excluded.* It is unrealistic to develop a complete estimation of capital costs and incremental recurring expenditures associated with the consolidation options presented because of the many uncertainties that are linked to each end of the transfer. Renovation and new construction costs on a per bed basis are offered as a reference point. While capital costs play a pivotal role in any decision-making process relating to the integration of clinical services, this assessment instead focuses its attention on gauging the *feasibility* of consolidation with consideration given to access, capacity levels, and service mix.

As reflected in the Study methodology, Mitretek approached this opportunity from the perspective of the Combined Beneficiaries who currently rely on these systems, as well as the U.S. taxpayers who financially support the Departments. As in the Puget Sound example, this approach focuses initially on the *desirability* of a particular option—specifically, on the potential for the realignment of health care delivery to improve patient access to care and/or to reduce the costs of delivering care. The VAMC Biloxi-Keesler example places less emphasis on access in this portion of the Market, given the location and capabilities of these two facilities, and allocates more attention to the possible economic benefits which could result from a future delivery model in which the resources could be leveraged to offer the same (if not a higher) quality of care at a reduced cost. From a Federal dollar perspective, logic would suggest that any cost savings in operations or capital expenditures would be shifted elsewhere in the Systems to enhance the delivery of health care services, to the benefit of the patients.

Scenarios A (Keesler as receiving facility) and B (VAMC Biloxi receiving) are summarized in two tables below. The estimate of the incremental capacity needed to absorb the transfer of Medical/Surgical

volume (in each direction) is based on a status quo environment (excepting the eastern Submarket patient migration assumptions noted earlier).

Table 18: Scenario A - Consolidating Inpatient Care in Biloxi/Gulfport Submarket

SCENARIO A.	Biloxi VAMC - Status Quo			Keesler - Status Quo			Post-Transfer at Keesler		
	M/S	ICU	Total	M/S	ICU	Total	M/S	ICU	Total

Status Quo Operating Costs									
Operating Cost per Day	\$1,534	\$1,850	\$1,555	\$2,111	\$2,799	\$2,291	\$1,723	\$2,577	\$1,865
Baseline Operating Cost (\$million)	\$19.4M	\$1.7M	\$21.1M	\$22.4M	\$10.5M	\$32.9M	\$33.2M	\$9.9M	\$43.1M
Operating Cost less Migration	\$15.7M	\$1.4M	\$17.1M	\$19.0M	\$8.7M	\$27.7M			

(a) FY 2002 total medical/surgical and critical care bed days of care.
 (b) Bed days of patients who reside in Eglin, Pensacola and Panama City and 50% of total bed days from Mobile Submarket patients.
 (c) Total capacity calculated based on available beds at 85% medical/surgical occupancy and 65% critical care occupancy.

The results shown in Scenario A indicate that Keesler, from a capacity standpoint, could assume the Medical/Surgical volume currently provided at VAMC Biloxi without the need for renovation or new construction (based on these static figures). Clearly, this does not suggest that other operational and facility-related requirements would not surface if such a transfer occurred. If additional beds were required (now or in the future), a total upgrade of existing space per bed would cost roughly \$121,000 (assuming 600 BGSF/bed and including project costs) in the Biloxi area.¹⁹ New construction per bed (at 700 BGSF/bed) would cost an estimated \$189,000.²⁰

This transfer could result in recurring cost savings on several fronts. The figures above show \$1.7M of annual savings in operations. As noted earlier, this uses a conservative discount of 10% from the total operating costs per unit – in this case, VAMC Biloxi’s total delivery costs. Other recurring costs, such as facility maintenance and repair (M&R), are difficult to estimate, but VAMC Biloxi currently spends an estimated \$2.6 million per year to maintain its inpatient facility.²¹ How the freed space at VAMC Biloxi is used post-transfer would determine the actual amount of savings or cost avoidance. For example, the M&R costs would be unchanged if VAMC Biloxi backfilled the space with extended care services, but it would be considered a “savings” in terms of annual M&R attributed to the future delivery of Medical/Surgical inpatient care. This

¹⁹ Marshall & Swift Level III renovation estimate (complete restructuring/total upgrade) adjusted for Biloxi area of \$144.48/BGSF and assuming 600 BGSF/bed with 40% project costs.

²⁰ Marshall & Swift; \$192.62/BGSF (adjusted for Biloxi area).

²¹ Estimated at 3% of the \$86.5 million Plant Replacement Value (PRV); VA CARES Valuation Study, 2002.

example would also apply to the \$1.3 million in deferred maintenance currently estimated for VAMC Biloxi.²²

Scenario B centralizes all Medical/Surgical care at VAMC Biloxi, and indicates a need for at least 24 additional beds to accommodate the incremental volume from Keesler. As noted in Scenario A, the capital requirements would start at \$4.5 million for new construction of 24 beds.²³ More importantly, this Scenario illustrates that, regardless of the number of beds needed, new construction would be required at VAMC Biloxi. This presents a host of additional challenges in terms of facility planning and the need for a mix of renovation and expansion.

Table 19: Scenario B - Consolidating Inpatient Care in Biloxi/Gulfport

SCENARIO B	Biloxi VAMC - Status Quo			Keesler - Status Quo			Post-Transfer at Biloxi VAMC		
	M/S	ICU	Total	M/S	ICU	Total	M/S	ICU	Total
Capacity (Bed Days)									
Baseline Demand (a)	12,695	912	13,607	10,596	3,761	14,357	23,291	4,673	27,964
Less: Pt. Migration from East (b)	(2,434)	(159)	(2,593)	(1,555)	(655)	(2,210)	(3,989)	(814)	(4,803)
Status Quo Demand	10,261	753	11,014	9,041	3,106	12,147	19,302	3,859	23,161
Maximum Net Capacity (c)	12,410	2,135	14,545	19,546	5,220	24,765	12,410	2,135	14,545
Capacity Surplus/Deficit	2,149	1,382	3,531	10,505	2,114	12,618	(6,892)	(1,724)	(8,616)
Equivalent Additional Beds Required	→						19	5	24
Status Quo Operating Costs									
Operating Cost per Day	\$1,534	\$1,850	\$1,555	\$2,111	\$2,799	\$2,291	\$1,705	\$2,577	\$1,850
Baseline Operating Cost (\$million)	\$19.4M	\$1.7M	\$21.1M	\$22.4M	\$10.5M	\$32.9M	\$32.9M	\$9.9M	\$42.8M
Operating Cost less Migration	\$15.7M	\$1.4M	\$17.1M	\$19.0M	\$8.7M	\$27.7M			

(a) FY 2002 total medical/surgical and critical care bed days of care.
 (b) Bed days of patients who reside in Eglin, Pensacola and Panama City and 50% of total bed days from Mobile Submarket patients.
 (c) Total capacity calculated based on available beds at 85% medical/surgical occupancy and 65% critical care occupancy.

Scenario B also presents an opportunity for recurring cost savings. The figures above place the operating cost savings at \$2M. As with Scenario A, other recurring costs, such as facility maintenance and repair (M&R) could also be avoided, depending on how DoD uses the freed space at Keesler after the transfer. Currently, M&R for Keesler Medical Center is an estimated \$4.8M per year.²⁴

3.3.4 Findings from the Assessment Applying the Collaboration Framework

The VA and DoD have 13 sharing agreements in effect in the Gulf Coast Market, involving the VA Gulf Coast Veterans Health Care System (GCVHCS) and six military facilities. At the time of Mitretek’s first site visit, the dollar value of these exchanges was approximately \$2M, affecting inpatient, outpatient, and administrative services. Examples of these include agreements between GCVHCS and Keesler for Behavioral Health services, and with NH Pensacola

²² VA CARES Valuation Study, 2002.

²³ Marshall & Swift new construction estimate adjusted for Biloxi area of \$192.64/BGSF and assuming 700 BGSF/bed with 40% project costs.

²⁴ Estimated at 3% of the \$160 million Plant Replacement Value (using \$200/sf @ 800,000 sf). Estimate supported by VFA review.

Mitretek recommends that DoD and VA establish a joint task force to move forward with an in-depth operational and facility assessment that includes a future consolidated model of Medical/Surgical care in Biloxi, based on the present and projected demand of the beneficiaries.

This near-term effort should set aside the uncertainty of policy-oriented issues such as BRAC and/or integration of GME programs. The detailed analysis should exhaust all avenues in terms of care delivery models, with patient demand and health care needs as the central drivers. Facility-specific considerations should be secondary in this planning process.

Mitretek recommends that the VA refrain from drawing any conclusions until DoD representatives have conducted a detailed reexamination of the Keesler alternative.

VA recently released the Realignment Study for VISN 16, which—through a cost/benefit analysis of several alternatives—concludes that all services currently offered at the Gulfport Division should be moved to VAMC Biloxi. This “preferred alternative” would allow for the “prediction of the outcomes for veteran patient services in a single consolidated location, to produce a single standard of care.”²⁵ A separate alternative included a “sharing agreement for provision of clinical services with Keesler” which was “retained, as local command support for sharing may change again during the CARES process.”²⁶ The current direction of this VA study signals a lack of collaborative planning on the part of both Departments.

Mitretek recommends the VA refrain from drawing any conclusions (and retract any offered) until a detailed reexamination of the Keesler alternative with DoD representatives is conducted. The current VA “preferred alternative” includes renovation of 123,000 DGSF and new construction of 155,000 DGSF with total capital costs of approximately \$30M.²⁷ Having applied the Study methodology to this issue, Mitretek feels it would be premature to draw conclusions before assessing a consolidated DoD/VA delivery model for services duplicated between DoD and VA, given the remarkable proximity of these three facilities.

Mitretek recommends that the organizations continue to consider, plan for, and act on most of the identified opportunities in the Market.

These identified opportunities present possible avenues for improving care delivery to military and veteran beneficiaries residing in the Market. All such actions should proceed from a deliberate, joint planning process.

3.4 Hawaii

3.4.1 Market Overview

The Hawaii Market is divided into four geographically-based Submarkets: Kauai, Maui, Oahu, and The Big Island. The Submarkets, counties and facilities in this Market are delineated in the table below.

Table 20: Study Market Area Definition for Hawaii

Submarket	County	DoD Facilities	VA Facilities
Oahu	Honolulu	<ul style="list-style-type: none"> - Tripler AMC 15th Med Group - Hickam AF Clinic - BMC Makalapa - BMC Kaneohe Bay - BMC Pearl Harbor Naval Shipyard - Schofield Barracks - BMC Camp Smith - TMC-1-Schofield - TMC Pohakuloa - East Pac Annex 	<ul style="list-style-type: none"> - VAMROC Honolulu
Maui	Maui		- Wailuku CBOC
Kauai	Kauai		- Lihue CBOC
The Big Island	Hawaii		<ul style="list-style-type: none"> - Hilo CBOC - Kona CBOC

Beneficiary Populations

In FY02, the Hawaii Market had approximately 248,500 eligible Combined Beneficiaries—approximately 15,000 of whom are “dual eligible”. The eligible population is divided almost evenly between DoD and VA; 55% of the eligible population is DoD.

The number of enrolled Veterans was equal to about 25% of the eligible Veterans. The DoD enrolled population exceeds the eligible population in Oahu, but is equal to less than 16% of the eligible population in the other Submarkets.

Unique users of the combined DoD/VA Systems equaled 88% of the combined enrolled population (net of dual users). The number of unique DoD users of either the direct care or indirect care system was equal to 96% of the DoD eligible population. The number of VA users equaled 55% of the VA enrolled. The percent of VA enrollees who used the system is much lower than in the other Markets (where it was 69-77%). In the DoD, 31% of the total users accessed indirect care. In the VA, 18% used indirect care. This is the highest use of VA indirect care in the three Study Markets. For *direct* care, 4% of users were dual users (used both systems).

and Eglin for Medical/Surgical care. VA and DoD officials have devoted a great deal of attention to two significant projects: the planning of a 140,000 square foot ambulatory care center adjacent to NH Pensacola, and a CBOC adjacent to Eglin AFB Hospital.

During the second site visit, both the quantitative methods used in rationalizing inpatient care and the qualitative Collaboration Framework were reviewed. Mitretek also presented and facilitated discussion about more than 50 opportunities for increased DoD/VA collaboration in the Market. These opportunities included ideas that were applicable to all Markets (grouped into the Collaboration Framework) as well as ideas specific to the Gulf Coast Market and/or specific to certain facilities in the Market. *Appendix B - Attachment 6* provides detail about these opportunities.

Along a continuum of Separate→Coordinated→Connected→Integrated→Consolidated, most of the relationships among the hospitals in the Gulf Coast Market are either Separate or Coordinated. In terms of clinical workload, VA GCVHCS and Keesler are classified as Connected because there are a high number of referrals between the two (e.g., DoD Psych is at VAMC Gulfport). They are also Connected in Logistics, since there is some mutual examination of best pricing and service. The relationship in staffing is Coordinated, as there is some sporadic cross-support. Management and Education are also Coordinated, with some joint planning and selective exchange of teaching methods. However, Facilities, Business Processes, IM/IT, and Research are all Separate in the Gulf Coast.

The relationships between VAMC Biloxi and Eglin and between VAMC Biloxi and NH Pensacola have the same profile: Connected for Clinical Workload, Coordinated for Management and Logistics, but Separate for Facilities, Staffing, Business Processes, Education/Training, and Research.

Feedback sessions during the second site visit confirmed that the Collaboration Framework is a useful way tool for looking at the relationships between VA and DoD within a Market. The framework can be used as a reference in future planning.

3.3.5 Recommendations for the Gulf Coast Market

The two Scenarios presented in this analysis illustrate opportunities for consolidation anchored by the fundamental measurement of capacity. The analysis finds that Keesler and VAMC Biloxi are currently independently well-positioned to meet the demands of their respective populations (without a capacity surplus). However, if immediate consolidation was required, these two Federal providers could merge Medical/Surgical care in a status quo environment without jeopardizing the existing mix of services, access to care, and/or the recurring costs of delivery. This analysis justifies the need to explore a future delivery model of centralized acute care services in Biloxi, MS. Mitretek offers the following recommendations:

Service Demand Workloads

Residents of the Hawaii Market area generated about 13,700 admissions and about 60,600 inpatient days of direct care in Medicine (including Rehab), Surgery, Behavioral Health (including Substance Abuse), and OB/Newborn (Post Partum and Nursery days were both counted). These volumes include out-migration, but exclude indirect care and extended care. Users from the Hawaii Market generated 138 Extended Care direct care admissions and approximately 13,800 Extended Care direct care inpatient days. During the site visits, Mitretek noted that access to long-term care is a challenge for the VA (and an Island-wide problem). Residents of the Hawaii Market generated nearly 1 million direct care visits—including out-migration—to providers, diagnostics, therapeutics, and emergency departments.

Because most of the admissions and inpatient days are at Tripler, it is necessary to use the Patient Classification System to identify the Veterans (K-61) who generate workload at Tripler. (Note that the while the K-61 patients have Veteran status, they were not necessarily under the care of, nor referred by, the VA system.) Using this methodology, it appears that veterans generated 16% of the admissions and 34% of the direct care inpatient days. DoD patients generated 84% of the admissions and 66% of the bed days. Veterans generated 85% of direct care Behavioral Health days while DoD patients generated 62% of total direct care Medicine days and 75% of the direct care Surgery days.

In 2002, the Service Lines of Internal Medicine, Family Practice, Mental Health, and Rehabilitation constituted nearly 50% of the total direct care outpatient workload (including visits to diagnostic departments such as radiology and therapeutic departments such as physical therapy) in this Market.

For outpatient direct care activity to *providers* (excluding diagnostics and therapeutics), more than 52% of volume in this Market is Primary Care (a combination of Family Practice, Internal Medicine, and Pediatric Service Lines). The outpatient visit case mix for DoD and VA are similar—except for Behavioral Health.

Indirect care is a major expense in this Market, and there is an opportunity to reduce this expense through more joint “resource planning” between the DoD and VA. It is possible that, while the individual volumes of the various Services in the DoD and the VA are too small to justify employing some specialists, the combined DoD and VA volumes will be sufficient in some specialties to employ a shared physician. A more detailed assessment of indirect care in this Market follows in *Section 3.4.3*.

Resource Supply and Capacity

The Hawaii Market area contains 15 DoD and VA facilities—one hospital and 14 outpatient centers (including four for active duty only). Tripler

was built in 1948, and the Study engineers rated the major buildings as Fair. The Study architects, who recently completed a Master Plan at Tripler, scored most of the clinical spaces Green for size and configuration (on a Red/Amber/Green scale—with Green being the best). A few spaces rate as Amber. They also noted that most spaces are not ADA compliant. Other facilities in this Market were not toured.

Both the DoD and VA use 85% inpatient bed occupancy as a planning standard for Medical/Surgical beds, and 65% occupancy is a commonly accepted high level Critical Care standard. This Study included an initial assessment of Medical/Surgical, Psychiatry, and Critical Care bed capacity versus demand. The Market has 190 staffed beds and 223 available beds in these categories. In 2002, Tripler had a weighted average staffed-bed occupancy of 63%.

Current Market Performance

Cost

The total baseline system-wide costs required to fund the care provided to Combined Beneficiaries in the Hawaii Market includes annual costs associated with both direct care (in-market and outmigration) and indirect care. Looking at the FY02 cost data for each of these components of care delivery provides the total annual baseline cost for the Combined Beneficiary population in Hawaii, as illustrated in the table that follows.

Table 21: Baseline Total Annual Care Cost to DoD & VA Beneficiaries in the Hawaii Market

Cost Figures in Thousands ('000s)	HAWAII COSTS BY AGENCY		
	DoD	VA	Total
In-Market Direct Care Provided			
Inpatient Care	93,149	11,253	104,402
Outpatient Care	153,434	49,457	202,891
Total In-Market	246,583	60,710	\$ 307,293
Out-Migration (Direct Care Provided Outside Market)			
Inpatient Care	1,789	669	2,458
Outpatient Care	3,833	490	4,323
Total Out-Migration	5,622	1,159	\$ 6,781
Non-Direct Care (Purchased/Fee Basis Care)			
Inpatient Care	7,606	2,899	10,505
Outpatient Care	23,609	1,725	25,334
Total Non-Direct	31,215	4,624	\$ 35,839
Total Delivery Costs			
Inpatient Care	102,544	14,822	117,366
Outpatient Care	180,876	51,672	232,548
TOTAL	283,420	66,493	\$ 349,913
Total Delivery Costs per Enrollee and per User (Per Capita Cost Figures are NOT in Thousands)			
Total Enrollees (1)	203,712	29,624	233,336
Total Cost per Enrollee	\$ 1,391	\$ 2,245	\$ 1,500
Total Market Users (1)	197,754	22,998	220,752
Total Cost per User	\$ 1,433	\$ 2,891	\$ 1,585

(1) Market enrollees and market users for FY2002 extracted from the Joint Assessment Study Series 4 Database

Access

Drive time analysis in Hawaii is limited to drive times within each island. In Oahu, all enrollees are within 60 minutes of a facility within their respective Systems. In the other Submarkets, which provide only outpatient clinic services, only VA beneficiaries are within 60 minutes of a facility. Although the DoD population in these Submarkets is small, opening the VA clinics to these beneficiaries will improve their access, and thus overall access measures for the Hawaii Market.

3.4.2 Options For Sharing/Collaboration Identified

Mitretek identified a list of potential sharing opportunities for Hawaii—some of which involve small shifts of volume, and others which will require more comprehensive change. Details are available in *Appendix A-Attachment 11*.

3.4.3 Findings from the Application of the Study Methodology to the Opportunity to Recapture Purchased Care

The geography of the islands and the distance from the mainland makes out-migration to other DoD or VA facilities less feasible than it is in other regions.

Thus, in situations where the existing DoD or VA facilities cannot provide care, the Departments must purchase needed care from the private sector.

There are opportunities for the VA and DoD in Hawaii to improve their performance in clinical and business processes such as coordination of care, utilization review, and clinical resource management. For currently purchased clinical services in which there are high volumes, complaints about poor access, and/or high costs, the two Systems should work together to recruit specialists to serve the Combined Beneficiaries.

As an attempt to begin to describe the magnitude of care that is “leaking from the system,” Mitretek analyzed outpatient indirect care for the DoD and VA in Hawaii. The level of detail available for this report *touches on* the levels of activity—but more detailed review of workload volumes would be required for the purposes of physician planning.

Table 22: Outpatient Indirect Care Activity by Product Line

Product Line	DoD	VA	Grand Total
Behavioral Health	14,808	602	15,410
Medical Specialty (incl. Rehab)	33,256	19,240	52,496
OB/GYN	5,074		5,074
Outpatient Specialty	8,469	45	8,514
Primary Care	93,360	1,786	95,146
Surgical Specialty	15,330	6,170	21,500
Grand Total	170,297	27,843	198,140

Note: Much of the DoD Primary Care is provided through managed care contracts²⁸.

When broken down by Clinical Service Line, there are some specialties in which the combined indirect care volume of the two systems might be sufficient to jointly employ a physician—and thus improve access for the Combined Beneficiaries. Due to the way the data are grouped, it is possible that much of this “specialty” volume actually occurs in the offices of Internal Medicine practitioners—particularly for the VA. However, the magnitude of the visit activity in these Clinical Service Lines makes them worthy of additional research. Some of the highest-volume Clinical Service Lines include Cardiology, Gastroenterology, Nephrology, Neurology, General Surgery, Orthopedics, and Dermatology, as shown in the table below.

Table 23: Outpatient Indirect and Direct Care Activity by Selected Clinical Service Line

Service Line	DoD Indirect Volume	DoD Direct Volume	VA Indirect Volume	VA Direct Volume	% of DoD total that is indirect	% of VA total that is indirect
Cardiology	3,233	17,271	3,610	877	16%	80%
Gastroenterology	2,840	4,438	2,038	2,174	39%	48%
Nephrology	821	7,027	3,797	299	10%	93%
Neurology	1,550	0	848	1,378	100%	38%

²⁸ **Managed Care Support Contracts (MCSC)** = Risk contracts with civilian provider networks to complement the health care services provided in the Military Treatment Facilities.

Service Line	DoD Indirect Volume	DoD Direct Volume	VA Indirect Volume	VA Direct Volume	% of DoD total that is indirect	% of VA total that is indirect
General Surgery	2,122	8,432	1,648	0	20%	100%
Orthopedics	3,318	31,806	2,474	2,143	9%	54%
Dermatology	3,163	10,837	350	777	23%	31%

It is interesting to compare indirect care volumes to direct care volumes in these service lines. In Cardiology, Nephrology, and Orthopedics, it is possible that the DoD could recapture their volume without additional providers, because indirect care activity accounts for 16% or less of the activity. For the VA, however, indirect care accounts for 54% or more of the volume in all of these specialties (recall, however, that the specialty volumes for VA include activity that may have occurred with an Internal Medicine doctor). The Combined Beneficiaries purchased over 5,000 visits in Gastroenterology—sufficient volume to jointly employ at least one physician.

Much of the DoD activity is likely to be TRICARE for Life, meaning patients over 65 in this category. Overall, 22% of DoD activity is over age 65, but between 24% and 55% of the activity in the Clinical Service Lines noted above is for patients over age 65.

It is also interesting to see that the DoD is purchasing a high volume of care in Mental Health and in Rehabilitation—traditionally two areas of VA clinical excellence. It could be worth evaluating whether the VA has capacity to serve some DoD beneficiaries in these two specialties.

Table 24: DoD Outpatient Indirect Care Activity

Mental Health	14,808
Rehabilitation	19,431

Overall, the outpatient indirect use rate of visits per 1,000 enrolled population is 836 for the DoD and 940 for the VA. The VA indirect care use rate is more than 60% larger in Hawaii than the other two markets. Of note, for inpatient activity, the indirect inpatient admission use rate per 1,000 enrolled beneficiaries was 8.4 for DoD and 11.7 for VA. The VA inpatient use rate is almost four times higher than in the other Markets, but the DoD use rate is only 1/3 that of the other Markets. Given the Hawaiian geography, one would expect to see lower indirect care rates than in other Markets since the majority of the beneficiary population in Hawaii lives near the Federal facilities (making access easier) and there are fewer alternatives for private care on the other islands.

If the two Departments work closely to analyze the volume and type of indirect care activity, they might consider joint recruitment in key specialties. As will be discussed in the next section, there is opportunity for DoD and VA in this Market to enhance their collaboration in business processes and leadership/governance. Physician resource management is affected by both of these domains of collaboration and could serve as excellent next step in coordination of efforts.

3.4.4 Findings from the Assessment of this Market along the Relationship Continuum Grid

Background

Mitretek found the examination of the Hawaii Market to be highly instructive in understanding the many dimensions (opportunities and challenges) of collaboration and in aiding the evolutionary development and application of the Study methodology. These dimensions are briefly described below.

The Hawaii Market has a history of VA and DoD sharing over a period of decades. Significantly, a close physical and organizational bond emerged in the mid- to late-1990s, when the VA needed to replace obsolete facilities at its downtown Honolulu locations and gain better access to inpatient and specialized care for veterans. VA moved to the Tripler Army Medical Center site. VA and DoD cooperatively developed four major capital projects: the Ambulatory Care Center (ACC), the Center for Aging (CFA), a Parking Garage, and a lease arrangement that placed VA administrative functions in an entirely renovated wing (E) of the hospital. This transition has been hailed as a major accomplishment and is credited with saving tens of millions of taxpayer dollars (compared to the alternative of building separate VA facilities in other locations).

At the time of their first site visit, Mitretek learned of many organizational accomplishments that have occurred in recent years. For example, the VA and DoD have jointly developed a master sharing agreement, which affects more than 25 distinct functions (annexes) and describes policies and procedures used to manage the arrangements. Interviewees frequently cited examples of existing successful sharing arrangements, including:

- Emergency Room
- Inpatient Medical Surgical Care (including shared use of hospitalists)
- Inpatient Psychiatry
- Dietetics
- Physical plant –housekeeping, security, and plant maintenance
- The active development of a shared Telehealth program (called The Pacific Telehealth Hui)

Tripler and VAMROC officials maintain records on sharing activities and noted that, in 2002, reimbursement exchanges between the two organizations totaled approximately \$18M for medical care and \$15M in administrative services. These are significant amounts, but relatively small in comparison to the \$349.9M cost of care rendered to Combined Beneficiaries within this Market.

First Round Site Visits

Interviews during the first site visits also surfaced a number of issues, concerns, and challenges facing VA and DoD staff as they attempt to

address the broad subject of sharing within the Hawaii Market. Examples of these include:

- IM/IT incompatibilities top the list of barriers for almost everyone.
- Apparently high levels of support for collaboration at both the national and local levels, but significant breakdowns as decisions move up the chain of command
- The need for single-point responsibility
- Lack of access to invest in collaborative initiatives and the need to pool financial savings to support other initiatives
- Significant gap between national, regional, and local leadership (and the front line) related to vision, strategy, and expectations
- Major differences in the use of language/terminology – Is the goal to cooperate, integrate, consolidate? What do these terms really mean?
- Mixed feelings re: whether momentum has been lost (“feeling stuck”)
- Different views re: how the relationship should be structured
- Strong views on the impact significantly different “missions and cultures” of the two organizations have on collaboration efforts
- Much too much time pursuing authorizations and reimbursement
- Huge need for common policies and standards
- Different medical staff and credentialing processes
- Frustrations with the lack of a useful and comparable data base

The site visit also revealed that, while there were examples of demand and supply imbalances, most individuals regarded these as peripheral to the other, more compelling sets of issues noted above.

The interview process uncovered more than 50 opportunities that may be pursued. Details of these are found in *Appendix A – Attachment 11*. Some of these relate to continued action or improvement on things that Tripler and VAMROC are already doing; others relate to ideas being planned or in process (such as development of ways to integrate product lines within the Department of Medicine). Interviewees identified many ideas on new actions or activities that the VA and DoD could pursue in the future. (The critical questions on the table were: Which of these initiatives should be preserved? Who is making these decisions? Who is going to be held accountable?)

The field visits further emphasized that VA and DoD officials on the Islands are interested in exploring completely new paradigms for improving their relationships, and in serving common patient needs throughout the Western Pacific region. Moreover, leadership had already conducted a planning retreat that described a proposed vision or “end state” that would make Tripler and VAMROC into an “integrated academic health care system” with one budget, one information system, one graduate medical education program, one research program, one logistic system, and one standard of care. Additionally, leaders of the two organizations wished to develop plans to explore, develop, and fund these

notions. VA and DoD officials hoped the Joint Assessment Study would help to move their organizations forward in these endeavors.

Application of the Collaboration Framework to the relationship between VAMROC and Tripler highlights many complex issues in the domains of collaboration. These include:

Patient Care/Clinical Workloads – The assessment involving Tripler and VAMROC indicated that the two organizations are largely Connected for outpatient services and Integrated for inpatient services. Participants emphasized that further drilldown of patient care activities by Clinical Service and/or Product Line is possible and would be necessary to depict an accurate picture of the relationships that exist within the patient care domain. Moreover, patient care and clinical workload issues are often “constants” in any sharing initiative because they are the motivating force behind most ideas. In a sense, the other collaboration domains are all in service of this domain when talking about the common patient care mission of the two organizations.

Facilities – Participants described their facilities as Connected, but not Integrated, which reflects how the facilities were developed. Clearly, acquisition of certain equipment and development of facilities should continue to proceed from joint capital planning.

Staffing – DoD and VA leadership speak of staffing collaboration as Integrated, citing many examples like the joint hospitalist program. At the same time, concerns about recruitment and retention of scarce physician and technical/professional services prompt leadership to recognize that collaboration on staffing can be greatly improved and will require detailed attention to human resource policies, procedures, and practices.

Business and Clinical Processes – Participants assessed these processes as, at best, Coordinated. For the most part, they are different and supportive of the separate work of the two organizations, reflecting entirely different accounting, fiscal, admission/discharge, medical records, and utilization management systems. Actions to improve collaboration in this domain should be a primary focus of the forthcoming Smith Amendment demonstration project.

Management and Governance – Participants rated the Management and Governance relationship as Coordinated, noting that VA and DoD already have two layers of structure in place: an Executive Management Board and a Joint Venture Steering Group. Generally, participants regarded historical organizational relationships as too often focused on reimbursement matters. They found the Joint Assessment Study process (both quantitative and qualitative) helpful in orienting the teams to longer range strategic matters as well as in dealing with ongoing daily operational concerns.

IM/IT – Participants scored this area as Coordinated, although most participants are highly critical of the lack of interoperability between information systems at the local level. While attainment of this objective will flow from national IM/IT initiatives, the two departments expect to continue to devise ways to communicate electronically in as many areas and activities as possible.

Logistics – The participants scored this area as Coordinated. Further collaboration in Logistics is regarded as dependent on national direction.

Education and Training – Participants scored their relationship in this domain as Connected, citing shared access to education programs and use of classroom facilities. There are attempts to collaborate on GME efforts, but the programs are largely distinct. Most parties see advantages in improving the triangular relationship between the VA, DoD, and the University of Hawaii.

Research – Both the VA and DoD have active research programs, which are Separate; each has its own funding sources (which tend to follow different protocols). The Systems completed a study that addresses the possibility of developing a joint biomedical research facility on the Tripler campus.

The table below summarizes the status of the VAMROC-Tripler relationships in a Relationship Grid.

Table 25: Tripler and VAMROC Relationship Grid

Domain	Separate	Coordinated	Connected	Interoperable	Unified
Clinical Workload	Insignificant referrals	Regular communications	High number of referrals	Specialty services of Tripler at one Tripler site	Protocol-driven management of all patients
Facilities	Distant	Some sharing where duplication exists	Projects & facilities come from master planning	Many departments share space	One facility or set of facilities
Staffing	Distinct	Support in peaks and valleys	Joint staff planning	High level of shared staff	Single staffing
Business Processes	Different	Reduce barriers	Work flows understood & noted on	Transparent	Single system
Management/ Governance	No Relation	Joint planning sessions	Overlap of key functions	Overlap of key functions	One governance & management structure
IM/IT	Separate systems	Evidence of "E" exchange of info	Moving toward systems interface	Complete interoperability	One system
Logistics	Little if any exchange	Borrowing, bartering and contractual exchange	Mutual examination of best pricing and service	Selective sharing of certain areas of inventory	One supply chain
Education & Training	Distinct	Selective exchange of methods	Frequent use of joint programs and curriculum	Most programs and curriculum are standardized	Unified program
Research	Distinct	Selective exchange of protocols	Joint planning and review of many studies	Significant overlap of protocols and review	Unified program

3.4.5 Recommendations for the Hawaii Market

Mitretek recommends that the two Departments work together closely to analyze indirect care activity—especially in specialties where the combined volume could justify jointly employing a specialist.

During the site visits, the DoD and VA both expressed need for additional specialists—particularly in Gastroenterology, Cardiology, and Dermatology. The Indirect Care analysis underscores the need to collaborate in physician recruitment and employment in these specialties. The two Departments should work closely together to analyze the volume and type of indirect care activity and determine in which specialties the combined indirect care volume could justify joint employment of a specialist, such as a Gastroenterologist. This is particularly useful if DoD wishes to recapture the volume of TRICARE for Life beneficiaries.

Mitretek recommends that the two Systems examine provider capacity levels in most specialties to determine whether there is excess provider capacity in either System.

For most specialties, the two Systems should first determine whether there is excess provider capacity in either of the Systems. For example, if DoD has excess capacity in a specialty, it should first attempt to recapture “leaking volume” to use up its capacity. If, after recapturing volume, some excess capacity remains, VA could take advantage of this opportunity to reduce fee-basis care.

Likewise, the Systems should identify and describe DoD indirect care activity for Mental Health and Rehab and determine whether DoD direct care system has capacity to recapture the purchased services. If so, the DoD should encourage beneficiaries to use the direct care system. If not, the Systems should determine whether VA has capacity to support some of the DoD’s needs.

Mitretek recommends that the DoD and VA together evaluate whether jointly employing specialists will help equalize availability and access.

Because of the dynamic nature of the deployment of DoD specialists, Mitretek recommends that DoD and VA together evaluate whether jointly employing specialists will help “even out” availability and access.

Mitretek recommends that, using the Collaboration Framework, the two Systems continue to pursue the 50 plus opportunities identified during the site visit.

However, these efforts need to proceed in an orderly, systematic, and information-driven manner. Leaders of both organizations must remain visionary and revitalize formal joint strategy, business, and facility planning efforts.

4.0 FINDINGS & RECOMMENDATIONS FROM RESEARCH AND FIELD WORK

As noted in previous sections, Research and field work has been an integral part of the design and execution of the Joint Assessment Study. Mitretek recommends that any other Market Assessments performed based on this methodology include Research and field work. Specific findings, and the exact manner in which they will be applied, should be tailored to the unique circumstances of those markets.

Any such future studies must consider historical trends and the current forces that are driving change. The perceptions of the involved individuals will inform the parameters of important issues and will greatly assist in setting the stage for change in any market. Described following are findings and recommendations stemming from the research and field work conducted as a part of the Joint Assessment Study.

4.1 Nature of Sharing Opportunities

The sharing legislation authorizes VA Medical Centers (VAMCs) and DoD's MTFs to become partners and enter into sharing agreements to buy, sell, and barter medical and support services. The law allows for the head of each medical facility (of either agency) to enter into agreements, and mandates that VA and DoD headquarters officials review the proposals for final approval.

Historically, VA and DoD sharing activities have fallen into one or more of three categories:

- Local sharing agreements, which allow VAMCs and MTFs to exchange health and support services to maximize their resources;
- Joint venture sharing agreements, which aim to avoid costs by pooling VA and DoD resources to build new facilities or to capitalize on existing facilities; or
- National sharing initiatives, which identify and implement interagency initiatives on a national scale. For example, VA and DoD have collaborated on the joint purchasing of pharmaceuticals, laboratory services, medical supplies and equipment, and other support services.

4.2 Organization and Reporting of Sharing Activities

As required by the Sharing Act, VA and DoD report annually to Congress on the status of DoD/VA sharing. The VA maintains a joint sharing database of sharing agreements, which has been used as the basis for reporting on these relationships.

Since 1997, the DoD/VA Joint Executive Council—and more recently a sub-council of this group: the DoD/VA Health Executive Council—has provided coordination and operational oversight of these affiliation activities.

The database maintained by the VA captures all DoD/VA-recorded sharing agreements. It details agreement information by number, DoD branch and facility, VA facility, effective dates, and contact information. It also details agreement information by affected service and whether the provider was VA, DoD, or both.

- In 2002, the database referenced 622 agreements in force throughout the US (all VISN and TRICARE regions).
- Each sharing agreement may affect one or multiple services or functions operating within a facility. These number more than 150 different services when tallied; some individual sharing agreements affect as many as 40 distinct services.
- Taken together, these 622 agreements affect some 6,017 services, or about ten services per agreement.

In addition to the central DoD/VA sharing database, sharing arrangements are maintained by each military service and by each VISN. For example, the Army Medical Department (AMEDD) maintains and regularly reports statistical and financial information on sharing arrangements by various Army Medical Centers. Thus, there is a wealth of data regarding the kind of sharing relationships the leadership in any market might consider.

4.3 Increasing Pressure for Change

Figure 1 in *Section 1.0*, entitled *Increasing Pressure for Change*, illustrates major planning processes and key studies that directly relate to the Joint Assessment Study. These trends and studies underscore the context that DoD and VA officials must acknowledge as they seek to move forward in strengthening their collaboration efforts. At least one major government investigation has been conducted each year since 1999 including: the 1999 Congressional Commission on Transitional Assistance (The Principi Study), a 2000 GAO Report on Resource Sharing Activities, the 2001 Assessment Report on Sharing Activities (Eagle Study), and the 2001-2003 Presidential Task Force process and reporting. The latter report, which has overlapped the conduct of the Joint Assessment Study, stressed the need to address four areas of concern; provide clearer leadership, create a seamless transition from the military to the VA, remove barriers to VA and DoD collaboration, and address the mismatch between VA demand and resources.

Each of these studies called for change and the adoption of principles that would foster fundamental improvements in the manner and structures by which VA and DoD relate to each other. A few prevailing themes, which were instructive to Mitretek in the design and conduct of the Study, include the following:

- The Status Quo is unsustainable.
- Performance shortfalls—Expectations have been met at neither national nor local levels.
- Health care collaboration and integration is inherently complex and difficult to implement.
- Successful collaboration is fundamentally a local market phenomenon but requires alignment at the national, regional, and local levels.
- Effective collaboration always involves interaction of people, and is therefore dependent on three things: leadership, trust, and communication.

Federal officials have recognized the issues raised when addressing any of the themes noted above. In recent years, initiatives that have a system-wide impact on both departments have begun. These include CARES, The Next Generation of TRICARE,

current and pending legislation such as the National Defense Authorization Act (NDAA '03) with particular reference to the Smith Amendment, and the ongoing work of the DoD/VA Joint Executive Committee (JEC) and Health Executive Committee (HEC).

Each of these initiatives calls for VA and DoD to consider, actively plan for, and carry out substantive collaborative activities in a wide range of subject areas including, but not limited to: information systems, capital asset planning, financial management, and clinical practice guidelines.

4.4 Three Levels of Sharing Opportunities (Levels I, II and III)

Mitretek's field work revealed a large number of sharing opportunities worthy of pursuit that are common to all markets. These cut across all departments and functional entities in both Systems. Mitretek categorized these, placing them within the nine domains and into the context of the three levels of potential action developed by the Study team (see *Figure 8* in *Section 2.4.4*).

This framework provides a structure for categorizing various sharing opportunities in three distinct levels.

Level 1 (Opportunistic) sharing opportunities represent activities that mostly focus on logistics, staffing and business and system processes and/or improvement of sharing activities currently in place. Characteristics of Level 1 sharing opportunities include:

- Existing sharing activities; (refine and improve)
- Largely invisible to the patient
- Locally managed
- Easiest to accomplish

Recognizing that major barriers exist (such as lack of integrated information management systems, billing and coding procedures, and reimbursement issues), Level 1 activities tend to be local and opportunistic. Many DoD and VA facilities have found temporary local solutions to these major barriers in order to sustain existing sharing activities. National solutions to these major barriers, as discussed previously, will enable increased sharing activities and will free up resources currently engaged in "bridging" disparate business and clinical support processes at a local level. In the interim, improvements in current structures, even if temporary, should continue for those facilities that are engaged in or are contemplating expansion of sharing initiatives

Level 1 sharing opportunities cut across all nine domains in the Collaboration Framework, as displayed in *Table 26*, below.

Level II (Actionable) Sharing Opportunities also cut across all 9 domains; however, these often involve movement of patients (patient care domain) or development of patient care facilities (facilities domain). Characteristics of Level II sharing opportunities include:

- Implies moving patients to facilities or modifying facilities to accommodate expansion of services

- Implies capital cost/investments
- Harder to accomplish

Level II Opportunities, such as the *redistribution of care sites*, represent significant challenges to local and regional markets. As discussed in this Study Report, the opportunity to consolidate care delivery between the DoD and VA is hampered by inconsistent policies, lack of incentives, and a myriad of disparities in mission, patient populations and the mix of clinical services within each delivery system. As demonstrated in this Joint Assessment Study, a true “market perspective” of the demand and supply requirements for care of the Combined Beneficiary populations can point to opportunities for redistributing clinical services and access points. These opportunities must also be examined from a qualitative perspective. The Puget Sound Market example shows that access to primary care services could be improved by re-distributing assets as well as changing policies and procedures. The Biloxi/Gulfport Submarket example demonstrates potential improvements in quality and cost by combining select inpatient services. *Redistribution of existing care* implies potential consolidation of select services, opening new or closing existing access points, and focusing on improvements in the sharing of specialty services.

Another example of a Level II activity is in the provision of *Behavioral Health services*. Both organizations provide outstanding Mental and Behavioral Health services as part of the clinical services core. The VA has an outstanding reputation for advances in Behavioral Health and, in fact, spends a significant portion of its health care dollar treating veterans with Behavioral Health issues. The DoD has very robust Mental Health, Family Advocacy, Social Services, ambulatory and inpatient Behavioral Health services. There are compelling reasons for each Department to maintain separate and distinct Behavioral Health services, depending on the requirements of the patient; however, there are also certain services that could be combined at a local market level to provide a uniform benefit to the beneficiaries. Inpatient Mental Health, as demonstrated in the Hawaii and Gulf Coast Markets, can benefit from combined resources and a more unified service offering.

Both the DoD and VA have established *special clinical programs* (formerly called Centers of Excellence) for concentrating resources, education and training, and facilities in highly specialized centers. Examples include Spinal Cord Injury, Traumatic Brain Injury, Post Traumatic Stress Disorder, Cardiovascular and other sub-specialty programs. Recruitment and retention of specialized providers, special equipment requirements and generally high unit costs have compelled each Department to concentrate these services. Additionally, the volume of patients requiring many of these highly specialized services is not sufficient to develop programs in every facility within all markets.

Currently, reimbursement issues provide a disincentive for the two Departments to collaborate in special clinical programs. GME and other requirements also impact decisions regarding the establishment and/or placement of such highly specialized services. In many cases, the low volume of patients in these centers, particularly patients requiring inpatient care, prohibit the individual programs

from achieving cost efficiencies. These programs are constantly scrutinized for opportunities to reduce costs and/or eliminate duplication within a given market or geography. As such, efforts to redistribute these care sites can be examined using methodologies like those presented in this Study.

Level III (Transformational) sharing activities are difficult to achieve and yet have the highest potential impact on cost, quality and/or access to care. Examples of Level III sharing opportunities include: development of interoperable IM/IT systems and common medical records, single governance and management within defined market areas, unified GME and research programs. Additional Level III examples are displayed in *Table 26*. Other characteristics of Level III (Transformational) sharing opportunities include:

- Major policy changes required
- Imply direction and guidance from National Headquarters
- Highest degree of difficulty
-

The following table displays examples of sharing opportunities derived from this Study. Although there are level I, II and III components to almost all sharing opportunities, the table below categorizes the opportunities into their primary levels.

Table 26: Common Opportunities for Sharing within the Domains of Collaboration

Domains of Collaboration	Examples of Sharing Opportunities	Level
Patient Care	• Develop common health promotion and prevention programs	I
	• Develop coordinated home care programs	I
	• Develop coordinated telemedicine programs	I
	• Develop uniform clinical practice guidelines	I
	• Share audiology services	II
	• Create joint hospitalist program	II
	• Develop joint ambulatory surgery programs	II
	• Coordinated mental health services and substance abuse programs	II
	• Develop comprehensive long-term care program	II
	• Create joint substance abuse program	II
	• Develop coordinated special clinical programs (e.g., cancer management, cardiology)	II
	• Consolidate inpatient medical service programs	II
	• Coordinate placement of primary care centers	II
	• Offer integrated clinical programs – all specialties	II
	• Develop shared Family Practice Residency program	III
Facilities	• Share library space	I
	• Share education space	I
	• Share available clinical space	II
	• Construct a joint ambulatory care center	II
	• Construct or renovate building for long-term care services	II
	• Consolidate ancillary services (e.g., radiology)	II

Section 4.0 – RESEARCH & FIELD WORK FINDINGS & RECOMMENDATIONS

Domains of Collaboration	Examples of Sharing Opportunities	Level
Staffing	• Coordinate recruitment and retention activities	I
	• Create joint “float” pools	I
	• Coordinate home care program staffing	I
	• Assign staff to cross-program/facilities	II
Clinical and Business Processes	• Develop coordinated QM/QI functions	I
	• Develop unified utilization management programs	I
	• Develop useful Balanced Scorecard metrics	III
	• Coordinate billing systems	III
	• Coordinate benefits eligibility	III
• Coordinate HR policies, particularly pay scales	III	
Governance and Management	• Establish coordinated, uniform approach to dealing with local community hospitals	I
	• Create a local joint planning office	I
	• Create single governance infrastructure	III
	• Develop joint management teams	III
IM/IT	• Institute joint procurement of IT systems (software and hardware)	II
	• Develop interoperable IM/IT system	III
	• Develop uniform medical record system	III
Logistics	• Implement joint transportation services	I
	• Share housekeeping services	I
	• Share laundry services	I
	• Share engineering and maintenance	I
	• Jointly investigate acquisition of new technology	II
	• Institute joint procurement of medical equipment	II
	• Offer single DoD and VA pharmacy formulary	III
	• Joint procurement of supplies (national contracts)	III
Education	• Coordinate training and education programs	I
	• Develop coordinated Residency programs	II
	• Create unified GME program	III
Research	• Seek funding for joint research projects	I
	• Share research space	II
	• Coordinate research activities with GME programs	II
	• Develop shared guidelines for principal investigators	II
	• Establish uniform research protocols	III

4.5 Recommendations from Research and Field Work

The following recommendations flow from the research and field work conducted as part of the Joint Assessment Study. Mitretek recommends the following “next steps” for consideration by the HEC:

1. Use the findings from the research, field work and application of the Study methodology to identify promising opportunities for sharing.

A significant message from the research and field work indicates that past sharing efforts have been “reactive” in nature, without reference to an overall construct for sharing.

2. Consider adopting the Domains of Collaboration and Level I, II, and III construct presented in the Joint Assessment Study as a way to resolve concerns from the field regarding the tension between local initiatives and national mandates.

Interviews with both national leaders and representatives in the Study Market areas revealed a disconnect between the needs, expectations and decision-making requirements at various levels within both the DoD and VA.

3. Use quantitative methods developed in the Joint Assessment Study to address Level I and II opportunities.

These quantitative tools can be extremely useful in verifying the dimension of an opportunity, informing its resolution (e.g., Level II opportunities highlighted in the JAS), and produce additional metrics for measuring the success of future collaborations.

4. Proceed with development of joint planning efforts at a market level. Include in these efforts strategic, business, operational and facility planning in order to implement sharing or collaboration ideas.

Collaboration efforts must be sustainable in order to overcome inherent challenges related to trust, communications and changes due to leadership turnover.

5. Use the findings from the Joint Assessment Study to inform other government initiatives, including the VA CARES process, Smith Amendment demonstration projects, and changes in TRICARE operations.

Members of the Joint Facility Work Group of the HEC and representatives from the Study Markets indicated that the methodologies used in the Joint Assessment Study will be useful in continued joint DoD and VA initiatives.

This page intentionally left blank.

5.0 FINDINGS & RECOMMENDATIONS FROM THE STUDY METHODOLOGY

Section 3.0 of this Report discussed the application of the Study Methodology in the three Study Markets. This final chapter summarizes several lessons learned, and makes general recommendations regarding the methodology (including both quantitative and qualitative dimensions) and its overall application in the Study.

Mitretek learned that both quantitative and qualitative issues must be assessed. The quantitative and qualitative aspects of the methodology are interdependent, leading to a holistic approach and methodology. The quantitative analysis can identify promising opportunities for increased sharing and collaboration by showing the “numeric” impact of rationalization or redistribution of access points and providers. While the quantitative/numeric outcome might appear quite *desirable*, it might not be completely *feasible* due to the numerous mission, policy, infrastructure, and organizational culture issues that raise practical barriers to implementation. The quantitative analysis demonstrates the numeric impact of an option and the qualitative analysis addresses the organizational impact and readiness for change.

Mitretek recommends that future sharing Studies recognize the value of a holistic approach, balancing the rigor of a quantitative analysis within the reality of a qualitative framework.

5.1 Quantitative Issues

5.1.1 Data Acquisition and Output

This Study used patient-record-level detail as a major component of the Data Repository. This yields several challenges, including the enormous size of the requested data files and patient confidentiality issues. If this Study methodology is repeated, the project timeline should consider that the size and confidentiality issues will result in long lead times to obtain the data.

Mitretek recommends that subsequent Study teams obtain the national data before embarking on site visits.

Further, the data itself requires filters, assumptions, groupers, etc., in order to convert record-level detail into valuable decision support information. Considerable expertise in database management and health care planning is required—as well as familiarity with the structure and contents of the DoD and VA datasets—to accomplish this task.

Mitretek recommends that future Studies continue to use a multi-disciplinary team of database management and health care planning experts.

The Study team needed to extract data from the Data Repository for multiple analysts who were studying different aspects of the Markets at the same time. To meet this need, Mitretek created a Decision Support Tool based on data extracted from the Oracle database (and dropped into Pivot Tables in MS Excel). Mitretek quickly realized that this tool had enormous potential to assist the health care planners in the Departments.

Mitretek recommends that the Pivot Table tool be further developed as a user-friendly decision support tool.

5.1.2 Significant Data Integration Is Required

The Study utilized over 15 datasets and 55.6 million records. Costs, inpatient volumes, outpatient volumes, indirect care, FTE's, enrolled beneficiaries, etc., each have different nomenclature and are measured differently between the two Departments. The ability to overcome this obstacle is a major accomplishment.

There are commonly used “groupers” for categorizing DRGs, ICD-9s, and CPT codes to product and service lines. Unfortunately, the groupers for each of the different kinds of workload data use different structures and hierarchies. Some data (particularly CPT level) are at too granular a level to use as encounter-level workload. In order to view the clinical activity from a marketplace perspective and to compare activity between the two Departments, a mapping of the hundreds of MEPRS codes and VA work units to a common set of clinical service lines and product lines is necessary. The Product and Clinical Service Line “Crosswalk” developed for this Study was an invaluable tool for and contribution to the analysis. It allowed the Study team to map inpatient activity, outpatient activity, indirect care, and FTEs to a consistently defined set of Product Lines and Clinical Service Lines.

Mitretek recommends that the two Departments review and agree upon a Product Line and Clinical Service Line Crosswalk prior to assessing another Market.

The electronic data from the DoD and VA were for the fiscal years 2002 and 2000. The site level data (mostly non-FTE supply data) were obtained via survey and site visits, and were for the year 2003. The analysis is based on a “snapshot in time,” and cannot take into account the dynamic nature of health care delivery in general, and the policy changes affecting the DoD and VA in particular.

Some of the site staff in the Markets viewed the national data as unreliable, due to inconsistencies in reporting by individual facilities. For example, the sites perceive that the MEPRS FTE data does not accurately reflect the true allocation of the providers' time. Nonetheless, a data-driven methodology must use data. The data contained in the datasets used are presumably the best data available for these kinds of analyses—especially as the purpose of this Study is *planning* and not detailed operational analysis.

The Data Repository and the assessments in this Study provide a unique and valuable snapshot of the marketplaces from the perspective of the Combined Beneficiary. As with any analysis, many assumptions must be made in order to gain useful decision support from the data. The Report should be considered an excellent high-level planning tool, and a starting point from which to begin “field testing” before undertaking any actions based on the analysis.

Mitretek recommends that the Departments strive to improve the reporting of data such that DoD and VA staff will more readily accept analyses based on those data.

5.1.3 Demand and Capacity Conversion Factors Are Required

In order to determine where current and future imbalances between the demand and the supply in a particular market exist, it is important to convert demand into encounter-level workload data and convert supply counts into capacity. In most cases, the datasets have data at the workload level, sufficient for comparing demand to capacity. For example, Bed Days of Care is a workload-level unit against which one can compare capacity (either inpatient beds or FTE’s) to support that workload. However, should the Departments wish to compare demand to capacity in some of the ancillary services, such as surgery or imaging, it is necessary to convert the data provided (at the MEPRS, Work Unit, CPT, ICD-9, or DRG level) into “cases” in order to compare demand/workload against the capacity to provide it. This Study developed initial “Demand Conversion Factors” to facilitate such an analysis in the future.

As stated elsewhere in this Report, supply is not the same thing as capacity. It was necessary to create “Capacity Conversion Factors” to convert, for example, a primary care provider into the capacity to provide primary visits. This Study developed an initial set of factors—based on DoD, VA, and/or Commercial standards—to convert supply into capacity. Although only a few factors were used in the base analysis, one deliverable with this project report is *an initial set of standards that can be evaluated for use by both Departments for the purposes of capacity planning*. The Departments may not agree with the factors used in this Study, and achieving consensus between the Departments on a common set of factors will be a complicated task. The Capacity Conversion Factors in this Study provide a “head start” on what will be a necessary tool for future sharing studies.

Mitretek recommends that the two Systems individually develop common measures for resource planning.

The process begins by clearly and consistently defining the measures and inputs (e.g., “an FTE is 2080 hours”, “an Available Bed is one that can be converted into use within 72 hours”, “the measure will be cases per OR rather than procedures per OR”) within each System. Ideally, the two Systems would develop common definitions for the measures and inputs. Then, realistic standards for each System must be developed. For example, the DoD could have a different standard for the

number of annual visits per provider than the VA if there are obvious reasons why the DoD productivity and VA productivity would be different. When possible, the standard should be developed at the lowest common denominator (such as visits per hour, rather than visits per year), as this will allow for better cross-referencing of the standards between the two Departments. This will also allow future assessment studies to measure capacity and plan resources in consistent and meaningful ways.

Mitretek recommends that DoD and VA officials continue to develop and refine the quantitative methodologies used in this Study, with particular attention to addressing and resolving the following issues: Data Acquisition, Data Integration, and Demand and Capacity Conversion Factors.

5.2 Use of the Collaboration Framework

The Collaboration Framework is a highly useful and generally well-received means of addressing the complex dynamics experienced by those responsible for carrying out collaboration and sharing activities. Its appeal seemed to rest in its elegant simplicity in helping Market representatives to view complex material, yet probe ways to apply and consider taking action.

Feedback on each of the four elements of the Collaboration Framework is described briefly below.

- The *collaboration continuum* proved useful in addressing problems of language and terminology which had been continually raised in the interviews and alluded to in some of the studies reviewed. The continuum shows levels of collaboration (Separate→Coordinated→Connected→Integrated→Consolidated) along with proposed definitions, which enabled participants to both understand and visualize the varying degrees of possible collaboration.
- The *domains of collaboration* was helpful in describing the major elements of collaboration. Field participants suggested use of the terms *enablers* and *disablers* to describe the vitality of these concepts when addressing the subject of collaboration. Several participants noted that most activities conducted within a hospital or health care setting could be grouped in to one or more of these categories. Others noted that actual language and descriptive use of such terms could be subject to interpretation, and language changes may be appropriate to a specific set of circumstances.
- The use of the *gold standard* helped to underscore the value of thinking about these domains as a “pulling” force toward a common vision, rather than merely to address problems to be solved. Most authoritative sources on organizational behavior state that it is more effective for an organization to pursue compelling goals than to focus on problem avoidance, detection, and solution. Moreover, the reference to ideal standards greatly helped in facilitating discussions regarding reasons that collaboration on a particular topic might be important. Reference to the gold standard provided a frame of reference for assessing where an organization might be placed

along the continuum and enabled participants to discuss the merits (and demerits) of increasing the levels of collaboration.

- The application of the *relationship grid* was an effective exercise in each of the second site visits. Its greatest utility lies in the recognition that *the nature and degree of collaboration that is appropriate for any market or designation of facilities will vary*. Variations will occur based on the type of service or function being considered and the unique circumstances of the market and set of facilities being examined.

Most of the assessment discussions revolved around the use and application of the elements of the relationship grid, as discussed below.

Patient Care/Clinical Workload

The patient care/clinical workload category evoked a lot of discussion in each of the second site visits. Examination of this domain clearly highlighted the value of undertaking a collaborative endeavor in the interest of patient care. A profile of clinical workload answers the question “What business are we in?” and underscores the value of having a commonly accessible data repository. It is helpful to have access to a side-by-side quantitative profiling of the departments or service lines, which provides a fact-based platform from which to address collaborative patient care initiatives.

The existing or desired degree of collaboration within the domain of patient care will typically vary by inpatient versus outpatient, and certainly by Product Line or Clinical Service Line.

Facilities and Equipment

Discussions concerning the domain of facilities and equipment focused on the geographic distance between two or more facilities. The “availability” (of space and equipment) and the physical and functional condition of affected buildings and departments highlight the need to undertake extensive levels of facility planning. Participants noted that facility-dominated collaboration is generally considered when a major capital asset is required.

Big payoff is possible in this domain. Tens of millions of dollars have been saved by the DoD and VA based upon the decision that beneficiaries of one System can use the acute care services of the other System or that an ambulatory care facility of one System could be co-located on the acute hospital campus of the other. Examples of these advantages have been experienced in each Market (and particularly in Hawaii), and promise to be more important in the future as each Department makes capital asset decisions.

It is expected that both VA and DoD will continue to emphasize the domain of facilities collaboration in the future. Participants pointed out the greater value of planning a new facility together (it is more effective and easier) rather than attempting to “undo” an existing set of facilities.

Staffing

The domain of staffing and the broad subject of allocating human resources can have a significant impact upon both the need and the ability to collaborate – i.e., it can be a *driver* or it can become a *barrier*. Participants pointed out that the extent to which scarce talents are shared, integrated or otherwise coordinated represents one of the best ways to help deliver patient care and affected support services. This is particularly important when considering the many serious staffing shortages that plague VA and DoD care providers throughout the nation.

On the other hand, participants consistently stated how important it is to understand some of the key variables within both Systems that impact the access to staff and the capabilities of staff. For example, the readiness mission of the DoD, and the DoD policy of transfers approximately every two years, have a significant impact on local staffing needs. Additionally, VA physicians' and clinical staff's lack of experience with delivering babies or caring for very sick children is a reality that may bound collaborative possibilities.

Different pay scales and/or union contracts also greatly influence staffing challenges. Discussions around staffing issues alone highlight how critically important well-established patterns for ongoing communication are.

Business Processes

The domain of collaborating on business and clinical processes addresses the importance of having smooth and efficient handling of clinical, administrative or support functions affecting inter-organizational transactions. Site visit discussions confirmed that developing other forms of system integration (e.g., IM/IT) without integrating business processes, can present a significant barrier to achieving expected efficiencies and cost savings. Site visit feedback also suggested that clinical processes have both patient care and business process implications.

The potential list of sharing examples and opportunities within this domain is long and varied. Most reengineering projects undertaken within health care facilities focus primarily on business and clinical processes. Sometimes it is difficult to measure precisely the impact of these processes; however, both staff and beneficiaries often describe these processes as the determinants of efficiency. A business or clinical process collaboration can be very helpful in addressing a particular process (such as utilization management or provider credentialing), but it needs to consider other domains.

Management & Governance

The management and governance domain engendered much discussion in the second site visit work sessions. Participants emphasized that leadership is a driving force in inspiring and bringing about any hope of success in VA/DoD collaboration. Structural and control issues must be framed to ensure that direction is clear and that orderly actions can be established. Thus, management and governance issues are of central importance as enablers of effective

collaboration. While there is debate about whether management and governance issues should precede or follow the development of collaboration plans, there is no doubt that a concept of rigorous joint planning is needed at all levels of the VA and DoD. There is evidence that these processes have begun, both nationally and in each of the markets, and they must continue.

Information Management/Information Technology

During local site visits, the lack of integrated information systems was consistently identified as one of the major barriers to substantive integration of services. Major investment of capital dollars will be required to address the problem in order to garner the needed support for system integration efforts.

Most authoritative inquiries on the subject of health care services (and every interview that Mitretek conducted in every facility) pointed to effective information management and integrated information systems as the single most important enabler to the safe and efficient delivery of care and to effective operation of administrative support activities. Achieving this goal, within the context of integrating the services of two separate organizations which have evolved in different ways over many years, clearly requires an evaluation of the opportunities for integrating both hardware and software systems at national, regional, and local levels. The need for easy access to both clinical and business information affects everyone in both Systems: clinicians, executive personnel, employees throughout the organization, and patients. IM/IT accessibility can either “make or break” the success of many collaborative activities.

The newly formed VA-DoD Joint Strategic Planning initiative identifies integration of information systems as one of its primary strategic goals. This written strategic plan states the intention to “Enable the efficient sharing of beneficiary data, medical records, and other information through secure and interoperable information management systems.”

Logistics (including Pharmacy)

VA and DoD participants in each Market pointed to the inherent logic in pursuing collaboration when managing the logistics of a health care enterprise. After all, both Departments must acquire and manage very similar supplies and equipment in carrying out their patient care duties. Yet, there are difficulties in dealing with multiple contracts and vendors, many of which are established nationally. The need for action is longstanding, and numerous activities are underway nationally to improve procurement and acquisition processes, establish standards for purchasing goods and services, and leverage favorable pricing capabilities.

A particular area of focus has been the desire to develop a common pharmaceutical formulary and apply it in ways that may mitigate the extraordinary cost of drugs commonly used by VA and DoD beneficiaries. The introduction of robotic pharmacies at both DoD and VA facilities provides a solid platform to support such goals.

Education

The domain of education was discussed in a number of ways in each site visit. Education is regarded as an area worthy of collaboration, despite differences between the two Departments.

The subject of GME was subsumed under this category and many participants felt that the force of GME within both organizations was so strong that it should be separately investigated as a distinct category within each market. Discussion often focused on the perception that the affiliations VA has with medical schools are (usually inflexible and) very different from the GME mission within the military. However, the military physicians' need for clinical volumes, which are often present within the VA environment, presents a rich opportunity for collaboration.

Research

The domain of research has strong potential for greater collaboration. Both organizations have strong research agendas, particularly at a national level. However, due primarily to different funding and research protocols, collaboration in research activities is relatively sparse. Many participants involved in the Study see collaboration in the rich and robust research activities as an untapped treasure that could greatly strengthen quality of care outcomes.

5.2.1 Recommendations

Mitretek recommends that the two Systems use the Collaboration Framework in other markets, as it can be replicated or modified as appropriate and applied to any market.

The Collaboration Framework allows for a commonly understood visual and language-specific frame of reference to discuss either current or desired models of organizational relationships. It implies that relationships are fluid and dynamic.

Reference to the Collaboration Framework may be less threatening to those involved when they are able to visualize and comprehend an appropriate pattern or level of relatedness that will be useful to their organizations. The framework leaves room for the possibility that "effectiveness" can exist within any of the domains of relatedness within the relationship grid. As such, a "snake diagram" may in fact be the optimal way to portray relationships between VA and DoD organizations on a collaboration grid.

Simultaneously, the framework can be improved upon by expanding on its use by each clinical service within the domain of patient care. GME should also be expanded and given special consideration because of its importance in most markets.

The framework concept lends itself to the application of metrics. Metrics can be applied to inform the degree of relatedness that currently exists within any of the domains of collaboration. Metrics can also be used to establish progress toward

(quantitatively) expressed goals. In this regard, the concept could leverage the balanced score card process with which both the VA and DoD are currently experimenting.

5.3 Identifying & Assessing Promising Opportunities

A substantial part of the Study mandate was to examine collaboration opportunities within the respective markets, using a methodology flexible enough to allow multiple perspectives on current and future possibilities within the specific market. These opportunities were derived from a combination of efforts involving interviews, document review at specific sites, data analysis, and feedback discussions.

- The site briefings included documentation on sharing activities in each Market, providing insight into the nature and extent of current efforts. The Mitretek team learned about the background and nuances involved in potential sharing activities through the interview process. Insights gained by looking at sharing opportunities for a given set of facilities from the perspective of leadership, market activities, facilities, and operations confirmed the many dimensions of the collaboration dynamic. These viewpoints resulted in the compilation of opportunities that could be addressed in different ways.
- Listing collaboration opportunities by Market (and for specific facilities) identified the common and unique opportunities most often cited by interview participants.
- Sorting the collaboration ideas into the nine domains was useful in two ways. First, it tested the validity of the domains as a logical way to segment opportunities. Second, it demonstrated the strong implications of collaboration ideas on one or more domains of activity. In the second round of work sessions, participants consistently expressed a desire to further segment patient care and clinical workload ideas as the principal driver in most of the options that are worthy of pursuit.
- Preparation of common “roll up” lists of collaboration possibilities informed the quantitative examination of distinct changes that could be made in the care location or points of access within each market.
- Finally, the examination of opportunities within each Market allowed formation of ideas for implementation actions available to VA and DoD officials.

Mitretek recommends that every Market adopt this comprehensive market assessment methodology and planning process in order to identify the range of opportunities open to it.

These opportunities are not difficult to discover; they can come from almost any quarter. The challenge is to systematically apply a holistic view in considering these opportunities. Above all, opportunistic initiatives must be supported by reference to valid and useful information, such as those developed in this Joint Assessment Study.

1 INTRODUCTION TO THE MARKET ASSESSMENTS

This Appendix includes, first, a summary of overall Study findings that can be applied to all Markets. Second, it contains three Market-specific summaries of the findings and recommendations assessing the Markets and applying the Study methodology. A detailed assessment of the baseline conditions of the Market (such as population, demand, supply, and cost) is followed by an application of the methodology to the individual markets. Finally, there are recommendations for each Market. Each Market Assessment also has Attachments: Opportunities, Functional Assessment, Facility Condition, and Supply Counts.

The applications of the methodology differ in their content, because each market has unique issues as highlighted below:

- **Puget Sound:** This summary emphasizes access to primary care services, and uses the methodology to demonstrate how access performance can be improved significantly by opening new access points and redistributing capacity from facilities with surplus capacity.
- **Gulf Coast:** This summary is focused on the inpatient services within a particular Submarket, and uses the methodology to demonstrate how inpatient resources can be consolidated to achieve long-term cost savings.
- **Hawaii:** This summary emphasizes improving business processes and collaboration in a Market that already exhibits a high degree of physical integration, and the potential to recapture indirect care volume through greater collaboration in this area.

The differences noted above also highlight the flexibility and adaptability of the Study methodology to address the particular circumstances of local Markets. During our site visits to the Markets, Mitretek observed that, at the local level, these Markets are often perceived as being unique and not subject to standard comparison analysis with other markets. While it does appear true that “all health care is local”, it is also desirable that planning for the delivery of health care services to Combined Beneficiaries should proceed from a comprehensive, data-driven, logically-developed analytic foundation, highlighting and respecting local issues and perspectives, but incorporating them systematically into a broader methodological context. Mitretek believes that the results documented in this Appendix demonstrate that significant progress has been achieved in developing this analytic foundation through this Study methodology. The Market assessments adopt a unique perspective—that of a “Combined Beneficiary.” A Combined Beneficiary is a current DoD, VA or dually eligible beneficiary, for whom health care access, cost and quality would be improved if sharing and collaboration between DoD and VA were increased. Adopting this perspective frames the Market assessments to address the common and best interests of the Combined Beneficiaries in the Market as a whole, rather than the potentially conflicting interests of the two delivery systems taken separately.

1.1 Defining Markets and Submarkets

In the DoD/VA Joint Assessment Study, each Market area is defined geographically, at both a county and ZIP code level. To the extent feasible, Mitretek used existing DoD and VA Market definitions¹, i.e., a Market area in the study was the smallest geographically delimited area that encompassed both the VA VISN-based and DoD MTF catchment-based Market area definitions.

Additionally, Mitretek subdivided the Market area into smaller geographic units—Submarkets—for meaningful analysis. Submarkets were defined based on existing geo-political boundaries (i.e., ZIP codes, counties), taking into account topographical features that may practically distinguish one Submarket from another (e.g., rivers, mountains, highway patterns, etc.).

It is important to remember that the designation of Market and Submarket areas are ultimately arbitrary; they are necessary to bound and limit the scope of the joint planning issues that the Study is trying to frame and address. The Market and Submarket area definitions can be expanded or contracted to accommodate changes in these issues.

In Puget Sound, the study Market area comprises 16 counties in the state of Washington, consistent with the VA CARES “Western Washington” Market. This Market includes a total of 13 DoD and VA health care facilities (including Troop Medical Clinics in Ft. Lewis). In the Joint Assessment study, the Puget Sound Market was divided along county lines into four Submarkets: North Sound, Seattle, South, and West Sound. Two of these regions contain both DoD and VA facilities; the other two contain only VA (Seattle) or DoD facilities (North Sound).

The Gulf Coast Market is comprised of eighteen (18) coastal counties, stretching approximately 240 miles from Panama City, FL to Biloxi, MS. This Market slices through VA’s VISN 16 (“South Central”) and DoD’s Region 4 (“Gulfsouth”). This Market includes 15 DoD and VA health care facilities. The Market was divided into five geographically based Submarkets: Biloxi/Gulfport, Eglin, Mobile, Panama City, and Pensacola. One of these markets contains only DoD facilities (Eglin) and one of these markets contains only VA facilities (Mobile).

In Hawaii, the Study Market area comprises four counties and four Submarkets. The Submarkets are the various islands: Kauai, Maui, Oahu, and The Big Island. This represents the DoD Hawaii TRICARE Region and the VA Pacific Basin Submarket (excluding Guam) of VISN 21.

1.1.1 Data Collection and Integration

The initial focus was to obtain from each agency data that are centrally stored and routinely maintained². Data that were not centrally available were obtained from the local facilities via pre-site visit surveys and during the site visit process. The Study approach necessitated developing methods and techniques to insure that demand and supply data from DoD and VA could be aggregated to permit meaningful comparisons.

¹ VA and DoD define their “Market areas” differently. VA specifies geographically delimited, non-overlapping areas—typically encompassing existing political subdivisions such as counties—within a larger Veterans Integrated Service Network (VISN). Also typically, these Markets are “anchored” by one or more VA Medical Centers (VAMC). DoD uses a “catchment area” concept. The outer boundaries of a catchment area are defined by a set distance from a Military Treatment Facility, typically 40 miles for a hospital, and typically 20 miles for an outpatient center.

² Details about data collection is found in Appendix B.

A major contribution of this study is the ability to analyze a common DoD and VA marketplace made up of Combined Beneficiaries. This is made possible partially through the development of a Product Line and Clinical Service Line Crosswalk³. In this crosswalk, the clinic stops⁴, bed sections, work units, and MEPRS codes⁵ of the DoD and VA were mapped to consistently defined Product Lines and Clinical Service Lines—thus allowing for cross-Departmental analysis. For example, “Cardiology” is a Clinical Service Line (within a Product Line called Medicine/Medical Specialty) that contains the clinics, diagnostic ancillaries, and inpatient units associated with cardiology—regardless of the individual work units and MEPRS codes of the different Departments.

1.1.2 Demand and Workload

Mitretek estimates the demand for health care services by counting the units of service used by the population of DoD and VA beneficiaries residing in each Submarket and Market⁶. This demand, for both inpatient and outpatient services, may be accommodated at facilities within the Market area (in-market); alternatively, beneficiaries may travel outside the Market to receive care (out-migration). Similarly, beneficiaries residing outside the Market may receive care from facilities within the Market (in-migration). The total health care workload at any facility is the combination of in-market and in-migration service volumes. Thus, the Joint Assessment Study methodology identifies two types of users:

- *Market users*, unique persons living in the Market area who receive health care services from the VA and/or DoD, regardless of whether the services were provided in or outside of the Market area. The count is unduplicated, i.e., each person is counted only once, at the Market area level
- *Facility users*, unique persons receiving care at a particular facility. This count is also unduplicated, but at the facility level. Because individuals can receive services at more than one facility in a particular year, the sum of facility users across all facilities in a Market is typically greater than the number of Market users, after accounting for the effects of in- and out-migration.

Mitretek uses discharges as the basic unit of service for inpatient care, and visits as the basic unit of service for outpatient care.

1.1.3 Supply and Capacity

Mitretek distinguishes between the supply of a resource at a facility, and the capacity of that facility to provide or deliver services. “Supply” is typically a count of a particular resource, such as beds or the number of staff. “Capacity” is an estimate of the volume of services that can be

³ The Product and Service Line Crosswalk can be found as an Attachment to Appendix B

⁴ Called “clinic stops” in the VA and “clinic visits” in the DoD. A visit is defined as one appearance by a unique person at an outpatient care clinic. During the course of one trip to a health care facility, a person may generate multiple visits by going to different clinics (e.g., primary care, radiology, pharmacy, etc.)

⁵ The Medical Expense and Performance Reporting System (MEPRS) code is a three digit code which defines the summary account and the subaccount within a functional category in the DoD medical system.

⁶ Details about demand and workload measures is found in Appendix B.

provided at a facility, to meet the demand. When considering a sharing opportunity, it is important to determine the practical capacity of the key productive spaces and staff. For example, an exam room that is open 10 hours per day has more capacity than an exam room that is open 4 hours per day. A physician that has two exam rooms might have more productivity/capacity than a physician with only one exam room might. An inpatient bed that is not staffed with nurses has no capacity until it is staffed.

The development of consistent standards across the DoD and VA will help facilitate the exploration of sharing opportunities in the circumstances where there might be a capacity and demand imbalance. An important component of decision support provided during this Study was the development of Capacity Conversion Factors⁷. These are factors—based on DoD, VA, and/or Commercial standards—used to convert supply into capacity. Although only a few factors were used for this Report, one deliverable with this project is an initial set of common standards that can be used by both Departments with the purposes of capacity planning. The Departments might not agree with the factors used in this study, and coming to agreement between the Departments on a common set of factors will be an extensive and complicated task. The Capacity Conversion Factors in this study are a head start on what will be a necessary tool for future sharing studies. An example of Capacity Conversion Factors that can be used in this setting is the conversion of inpatient beds to patient days capacity with an occupancy rate standard. An application of this factor is shown later in this report. Another example, converting primary care providers into capacity to provide visits, is described in the primary care rationalization example later in this report.

Researching, developing, and agreeing upon conversion factors is a substantial task—and the initial set of standards in this report should not be considered a completed effort. Rather, it can be considered a catalyst for further development by the two Systems.

It is important to acknowledge that some of the national data are viewed by the sites in the markets to be unreliable, due to the inconsistency of reporting by the individual facilities. For example, the sites feel that the MEPRS Full Time Equivalent (FTE) data do not reflect accurately the true allocation of time of the providers. However, the data contained in the datasets used are presumably the best data available for these kinds of analyses—especially since the purpose of this study is for *planning* and not detailed operations analysis.

1.2 Identifying and Analyzing Options

As part of the Joint Assessment study, Mitretek developed a standard approach for developing specific health care delivery system options to highlight opportunities for greater sharing and collaboration between DoD and VA. Incorporated into the replicable methodology developed as part of the study, the approach is intended to be applicable to any market area (i.e., not limited to the three Market areas in the present study), and any broad grouping of clinical services (e.g., primary care, medical/surgical/behavioral outpatient specialty care, routine and tertiary inpatient care, etc.).

Comparing demand and supply identifies options for achieving balance within a Market or Submarket. The Mitretek approach focused initially on the *desirability of a particular option*, specifically on the potential for a rearrangement of health care delivery volumes, capacity, and resources to improve access to care and/or to reduce the costs of delivering this care. Mitretek

⁷ Details about the development of Capacity Conversion Factors can be found in Appendix B.

recognizes that this approach temporarily suspends consideration of the practical constraints on and real-world barriers to implementing the options that are identified as a result of this evolutionary process—their feasibility. Based on the site visits to the Market areas, Mitretek is very aware of the specific challenges that influence opportunities for greater sharing and collaboration between DoD and VA. However, Mitretek believes that focusing on desirability first allows identification and calculation of the “benefits”—in improved access and reduced costs—of each option, and then to identify and estimate the “costs” involved, i.e., the investments needed to ameliorate or eliminate the specific barriers or impediments to implementation

To identify options, Mitretek developed a 3-step evolutionary rationalization process:

1. *Rationalize access* by opening the existing facilities of each system (DoD and VA) to provide health care services to the beneficiaries of the other system;
2. *Rationalize resources* by redistributing volumes and delivery capacity—within geographic access standards—to balance demand and supply at individual facilities, within specific Submarkets, and across the Market as a whole; and
3. *Rationalize access points*, by opening new and/or closing unneeded locations of service, to further improve access and reduce costs.

1.2.1 Collaboration Framework

Mitretek developed a Collaboration Framework to explore and systematically describe the domains in which sharing activities take place, and to identify the relative readiness and maturity of the local organizations to address and reduce the barriers to collaboration⁸. The Collaboration Framework assesses the current DoD and VA organizational relationships along a variety of Domains of Collaboration, such as Clinical Workload, Facilities, IM/IT, Staffing, Logistics, Business Processes, and Management/Governance. This evaluation provides a framework for the practicality of the opportunities for sharing and the organizational effort required for implementation. The elements of this framework can be used as a planning tool and to aid work needed to carry out initiatives. In this regard, each of the domains or categories can be treated as *critical success factors* and further analyzed in ways that probe the question, “How can DoD and VA health care organizations address these collaboration categories so as to improve access, cost, and quality?”

1.2.2 Cost

The total annual cost of providing health care to the DoD and VA beneficiaries is an important study criterion for assessing the current combined DoD/VA delivery system’s performance. In fact, the total cost to these two federal agencies to provide health care to their beneficiaries in this market, now and in the future, is probably the single most relevant baseline metric for assessing the combined DoD and VA system’s current performance from the taxpayer’s perspective.

The total annual cost of care for the Study Markets was quantified for the analysis year (FY02 for this Study) utilizing the annual operating cost data elements that are available as part of this Study methodology database⁹. The costs that were incurred by DoD and VA in FY02 to fund the

⁸ Details about the Collaboration Framework can be found in Appendix B.

⁹ Details about how cost analyses were completed is found in Appendix B.

care required by the Study Market beneficiaries represent the current baseline total annual system costs for the Market. This current baseline system cost is an important benchmark to establish in order to facilitate analyses of sharing opportunities that are identified for DoD and VA. The total baseline system-wide costs required to fund the care provided to the beneficiary population in the Study Market includes the annual costs associated with the following:

- Direct care services provided by the DoD and VA facilities located *within* the Study Market to DoD and VA beneficiaries who reside within the study market area, i.e., in-market direct care;
- Direct care services utilized at other DoD and VA facilities *outside* the Market by beneficiaries who reside within the Market area – i.e., out-migration; and
- Indirect¹⁰ care services that are purchased from other providers by DoD and VA for their beneficiaries who reside within the Market.

Including the FY02 cost data for each of these components of care delivery, i.e., all services provided directly by DoD and VA facilities either within or outside the market and those services purchased by DoD and VA for their beneficiaries who reside within the market area, provides a complete picture of the total annual costs funded by DoD and VA to care for the Market beneficiary population. In conducting a business case analysis for any specific sharing opportunity for a Study market, the expected annual incremental impact on these baseline system-wide costs need to be projected in order to provide an appropriate measure of the relative cost impact of the initiative on the total system, as opposed to the measuring the expected impact on just one of the two federal agencies.

The baseline annual costs for each Study Market summarized in the Report provide a high-level perspective of major categories of services, such as inpatient care and outpatient care, in the aggregate for the entire Study Market. It should be noted that in addition to this ability to calculate the current baseline cost performance for major categories of services such as these in the aggregate and at the total market level, the data available with this Study methodology will enable the analyst to calculate the current baseline cost performance for specific sub-segments of each Study Market, such as select geographic submarkets (e.g., a county within the market), for select beneficiary populations (e.g., active duty versus other beneficiaries in the DoD or by priority level within the VA), and for select Product or Clinical Service Lines (e.g., primary care only). This provides the ability to document a baseline or “status quo” cost performance at either a submarket, beneficiary group, and/or at a Clinical Service Line level for comparison purposes that will be most appropriate to the particular sharing opportunity being assessed. Such Product and Clinical Service Line level incremental cost impact analyses will be illustrated in the individual Study market assessments that follow.

1.2.3 Access

Access performance is measured by the proportion of enrollees and/or patient care workloads, typically expressed as a percent, that are currently within the DoD/VA drive-time standards for geographic access to services¹¹. The current access baseline for enrollees and for primary care

¹⁰ Indirect care is defined as purchased care by the DoD and fee-basis care by the VA

¹¹ Detail about how access performance measurements were completed is found in Appendix B.

workloads are measured based on the drive time to *any* facility within the beneficiary’s respective system. Access for inpatient care is measured based on drive time to *any* inpatient facility within the beneficiary’s respective system. Sharing opportunities that improve access result in increasing this percentage over the current access baseline. The drive-time standards utilized for this study for DoD and VA are as follows:

Table 1: Drive Time Standards

Type of Service	DoD Standard	VA Standard	VA Rural Standard
Primary Care	30 minutes	30 minutes	30 minutes
Specialty Care	60 minutes	60 minutes	90 minutes
Inpatient Routine Care		60 minutes	90 minutes
Inpatient Tertiary Care		240 minutes	Within VISN

1.2.4 Facility Condition

Architects and engineers in the project team completed cursory reviews of many of the clinical buildings in the Markets¹². They reviewed the spaces for functionality and the buildings for condition. These brief assessments are not meant to replace a comprehensive Facilities Master Plan or a Facility Condition Assessment. Rather, they are high-level assessments to assist in planning decisions. The departments were subjectively scored on a Red/Amber/Green scale ((on a Red/Amber/Green scale—with Green being the best) and the buildings were scored on a Poor/Fair/Good/Very Good/Excellent scale. An explanation of the scoring and detailed scores of the many of the departments and buildings are available as an Attachment to the Market Assessment Appendix.

1.2.5 Time

The Market assessments are based on a “snapshot in time”—FY02—and do not take into account the very dynamic nature of health care delivery in general and the policy changes affecting the DoD and VA in particular.

¹² Detail about facility condition assessments is found in Appendix B.

Structure

The structure of this Appendix is as follows:

- Introduction & Overall Market Findings
- Market Assessments: Puget Sound, Gulf Coast, Hawaii
 - Description of the Market
 - Overview
 - Population
 - Service, Demand, and Workloads
 - Current Market Performance
 - Findings from the Application of the Quantitative Study Methodology
 - Findings from the Assessment Applying the Collaboration Framework
 - Recommendations
 - Market Assessment Attachments:
 - Options for Sharing/Collaboration Identified
 - Functional Assessment Definitions
 - Functional Assessment Grid
 - Facility Condition Grid
 - Supply Counts

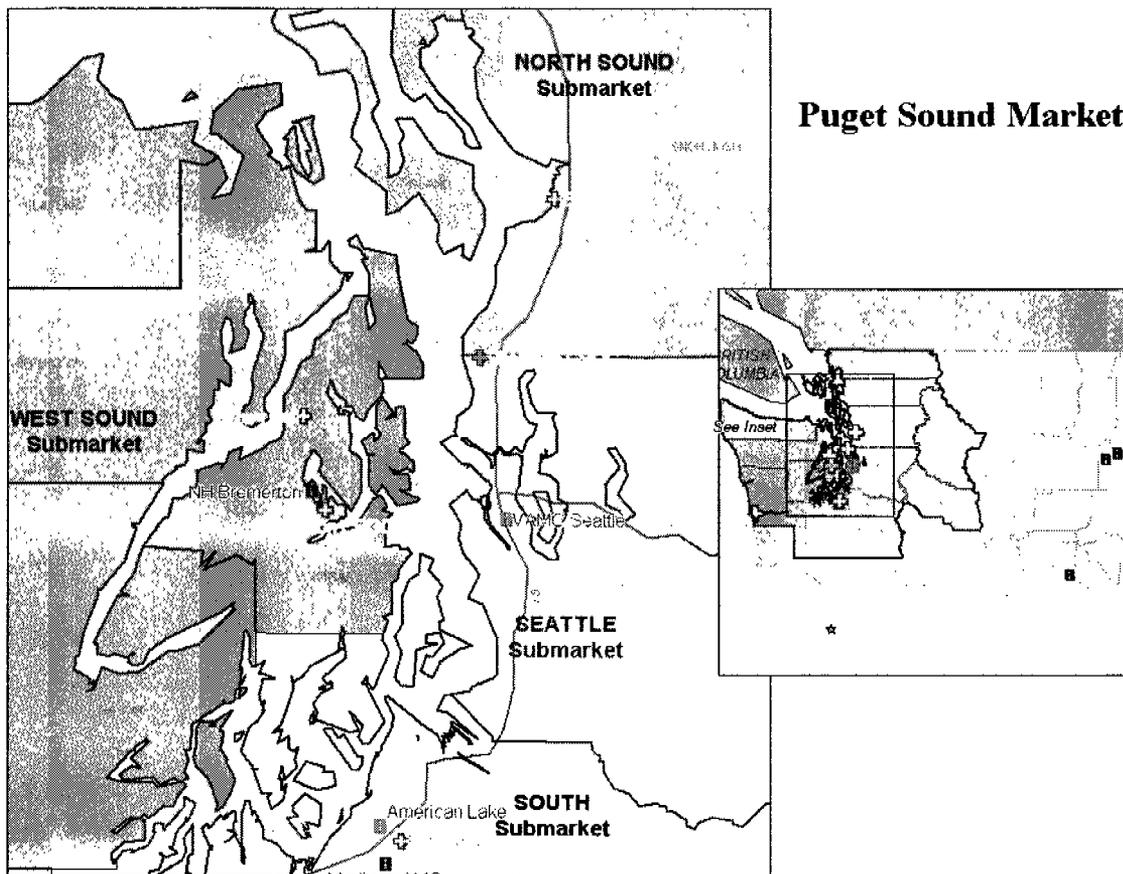

In addition to the findings here, a section of the main Report outlines Findings and Recommendations specific to the Methodology and Process.

The Study Data Repository and the Assessments to follow provide a unique and valuable snapshot of the marketplaces from the perspective of the Combined Beneficiary. As with any analysis, many assumptions must be made in order to gain useful decision support from the data. The report should be considering an excellent high-level planning tool and as a starting point requiring field-testing before undertaking any actions based on the analysis.

**PUGET SOUND
MARKET
ASSESSMENT**

2 MARKET ASSESSMENT- PUGET SOUND MARKET

A goal of this study is to view the market area from the perspective of the Combined Beneficiary¹³, rather than from the perspective of the System delivering the care. Thus, this Market has been divided into four Submarkets—based on geography rather than existing care delivery models. The Submarkets, as shown in the map below, are North Sound, Seattle, South, and West Sound. The North Sound Submarket is comprised of Chelan, Island, San Juan, Skagit, Snohomish, and Whatcom counties. The Seattle Submarket is comprised of King County and Kittitas County. The South Submarket includes Lewis, Pierce, and Thurston Counties, and the West Sound Submarket includes Clallam, Gray’s Harbor, Jefferson, Kitsap, and Mason Counties.

The Puget Sound Market Area for this Study consists of:

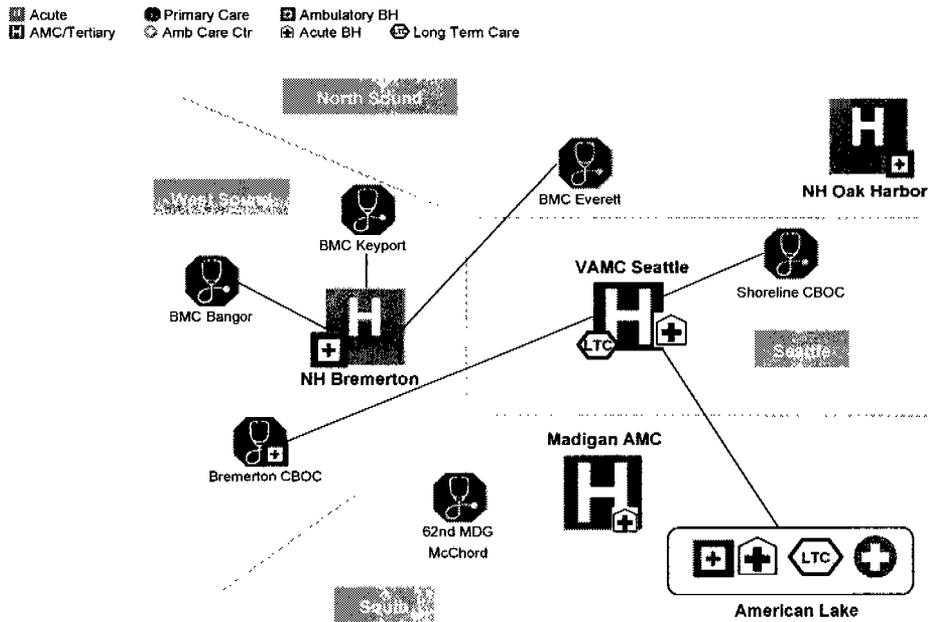

¹³ See the Introduction of this Appendix for a definition of Combined Beneficiary.

Table 2: Study Market Area Definition for Puget Sound

Submarket	County	DoD Facilities	VA Facilities
North Sound	Chelan Island San Juan Skagit Snohomish Whatcom	<ul style="list-style-type: none"> - NH Oak Harbor - Branch Medical Clinic Everett (BMC Everett) 	-
Seattle	King Kittitas	-	<ul style="list-style-type: none"> - VA Medical Center Seattle (VAMC Seattle) - Seattle Shoreline Clinic (Contract)
South	Lewis Pierce Thurston	<ul style="list-style-type: none"> - Madigan Army Medical Center (Ft. Lewis) - 62nd Medical Group - McChord AFB - Okubo Family Practice Clinic - Fort Lewis - Troop Medical Clinic #1 - Ft Lewis 	- American Lake VA Medical Center
West Sound	Clallam Grays Harbor Jefferson Kitsap Mason	<ul style="list-style-type: none"> - NH Bremerton - BMC Subase Bangor - BMC Keyport - BMC Puget Sound 	- Bremerton CBOC

The basic relationships between the Submarkets and their facilities are illustrated below.

Figure 1: Facilities in the Puget Sound Market Area

2.1 Populations

The Puget Sound Market area is unique in that it has two tertiary facilities (VAMC Seattle and Madigan), and that access to facilities is complicated by the many waterways in the area. Further, the area is a popular location for DoD retirees—thus there are a high number of dually eligible residents. This presents both challenges and opportunities. Although the combination of the using populations in the Systems is large, it might not be large enough to support two tertiary programs in some Clinical Service Lines. For example, offering open heart surgery at both VAMC Seattle and Madigan.

The topography of the Market makes meeting primary care access drive-time standards difficult—since towns that appear near to each other on the map are sometimes distant in terms of drive time (e.g., the need to take a ferry increases drive time). Since both Systems have 30-minute drive time standards for access to primary care, and there are some Submarkets in which facilities for only one of the System's exists, access to each other's facilities has the potential to improve access in these Submarkets. An example analysis of the opportunity and impact of rationalizing access to primary care follows later in this Appendix.

2.1.1 Eligible Population

The Puget Sound Market Area has approximately 740,000 eligible Combined Beneficiaries; of this number, approximately 55,000 beneficiaries are "dual-eligible," i.e., they are eligible to receive health care services from both DoD and VA. This population represents 16 counties in the Puget Sound area. Sixty-four percent (about 472,000 people) of the eligible population are VA eligible (including dual eligibles). The North Submarket and the Seattle Submarket each make up +/- 25% of the eligible population, the South Submarket represents 34% of the eligibles, and the West Submarket represents about 13% of the eligible population.

Specifically, about 25% of the eligible population (85% of which are Veterans) lives in King County in the Seattle Submarket, and another 25% (equally DoD and Veterans) lives in Pierce County in the South Submarket. Another 12% each lives in Snohomish County (75% Veterans) in the North Submarket and Kitsap County (57% DoD) in the West Submarket

In the Puget Sound Market overall, 19% of the 268,000 DoD eligible population are Active Duty, 29% are Active Duty Family Members, 20% are Retiree, 31% are Retiree Family Members (and 1% "Other"). Of the 472,000 eligible Veterans, 56% are Priority Group 8 and 20% are Priority Group 5. The rest are spread with about 3-6% each in the other Priority Groups.

2.1.2 Enrolled Population

The number of Combined Beneficiaries who were enrolled in 2002 (399,000) was equal to 54% of the number of eligible. Specifically, the enrolled Veterans (87,000) equaled only 18.5% of eligible Veterans, while the number of enrolled DoD exceeds the number of eligible DoD. (Note that for DoD there are actually more enrolled than eligible—because DoD beneficiaries can be enrolled in a facility outside the Market area and because the analysis includes beneficiaries from the enrollment data who are not enrolled to a specific DoD facility). The number of enrolled Veterans was less than 25% of the number of eligible Veterans in all counties except for Pierce County (26.5% enrolled) in the South Submarket. In the North Sound Submarket—the one with no VA facilities—only 13% of eligible Veterans are enrolled. (This compares to a high of more

than 30% VA enrollment as a percent of eligible in the Biloxi/Gulfport Submarket of the Gulf Coast Market).

Below are tables that display the enrolled population broken down by Priority Group¹⁴ and Beneficiary Category (Active Duty, Active Duty Family Members, Retiree, Retiree Family Members).

Table 3: VA Enrolled Population by Priority Group

PG 1	PG 2	PG 3	PG 4	PG 5	PG 6	PG 7	PG 8
18%	12.5%	22.3%	3.4%	23.7%	2.3%	1.2%	16.6%

Table 4: DoD Enrolled Population by Beneficiary Category

Active Duty	Active Duty Family Members	Retiree	Retiree Family Members
15.3%	46.4%	13.9%	24.5%

2.1.3 Users

The number of unique Combined DoD/VA users equaled 81% of the combined enrolled population. This figure is for users of the direct or indirect care system (net of dual users). The number of unique DoD users (of the combined direct and indirect care systems) was equal to 91% of the DoD enrolled population. And the number of unique VA users (87,000) equaled 69% of the VA enrolled. Indirect care is Purchased Care for the DoD and Fee Basis Care for the VA.

In the DoD, 36% of the total users accessed indirect care. In the VA only 8% used indirect care. For *direct* care, 9% of users were dual users (used both systems). In the South Submarket, 12% of users were dual users, in the West it was 7%, in the North 4%, and in Seattle 3%.

2.2 Workload

2.2.1 Inpatient: Direct Care

Residents of the Puget Sound Market area consumed approximately 23,750 discharges and roughly 117,000 inpatient days of direct care in Medicine (including Rehab), Surgery, Behavioral Health (including Substance Abuse), and Ob/Newborn (Post Partum and Nursery days both counted). These volumes include out-migration to direct care providers outside the Market, but exclude purchased care and extended care.

Direct care discharges for this type of care varied by Beneficiary Group: for the VA, 32% of discharges were for Priority Group 1, and 23% were for each Priority Group 4 and 5. Priority Group 3 made up only 10% of the discharges. For the DoD, 47% of discharges were consumed

¹⁴ VA priority groups are based on combinations of the extent of service-connected disabilities and income/net worth. They priority groups currently range from 1-8 with 1 being the highest priority for enrollment.

by Active Duty Family Members, 18% by Retirees, and 19% for Retiree Family Members. Only 15% of discharges were generated by Active Duty.

Sixty-eight percent of the discharges and 45% of the days were DoD. Thirty-two percent of the discharges and 55% of the days were VA. Seventy-three percent of the Surgery discharges and 62% of the direct care inpatient days were generated by the DoD. Fifty-eight percent of the Medicine discharges and 41% of the days were for the DoD, whereas 79% of the Behavioral Health discharges and 95% of the direct care days were for the VA. Note that more than 8,500 of the Medicine days for the VA are Rehab Medicine and 2,700 of the Medicine Days for the DoD are Pediatrics. The difference in proportion of discharges and days is due to length of stay—as seen in the table below.

Table 5: Average Length of Stay by Product Line- Market Users

Product Line	DoD	VA	Combined
Behavioral Health	2.85	13.14	10.98
Medicine (incl. rehab)	3.48	6.94	4.93
Surgery	3.58	5.81	4.19
Ob/Newborn	2.88	N/A	2.88

Table 6: Inpatient Days by Product Line

Product Line	DoD	VA	Total	% DoD	%VA
Behavioral Health	1,599	27,824	29,423	5%	95%
Medicine	20,138	28,951	49,089	41%	59%
Surgery	13,480	8,209	21,689	62%	38%
Ob/Newborn	17,090		17,090	100%	0%
Total	52,307	64,984	117,291	45%	55%

As seen in the patient days case mix table below, of direct care inpatient days generated by Combined Beneficiaries from this market, 42% were for Medicine, 25% for Behavioral Health, 18% for Surgery and 15% for Ob/Newborn. Note that the case mix for DoD and VA are quite different. Of the VA patient days, were for Behavioral Health and 45% for Medicine. This compares to 3% and 38% respectively for the DoD. Of DoD’s direct care patient days, 26% were Surgery—compared to 13% for VA.

Table 7: Percent of Total Inpatient Days by Product Line and Service (Case Mix)

Product Line	DoD	VA	Combined
Behavioral Health	3%	43%	25%
Medicine	38%	45%	42%
Surgery	26%	13%	18%
Ob/Newborn	33%	0%	15%
	100%	101%	100%

(Totals exceed 100% due to rounding)

Based on the enrolled populations of the two systems, there are the following *direct care* use-rates per 1,000 enrolled. This means these use rates exclude the purchased care/fee basis care—so it reflects only the use of the MTFs and VA facilities. In the DoD, 36% of the total number of

users in this market used the purchased care system—and those users' activity is not reflected in these use rates. (In the VA, 8% of total users accessed fee-basis care). Nonetheless, the table below shows clearly the difference in patient profile between the DoD and VA.

Table 8: Direct Use Rates per 1,000 Enrolled Population (In Bed Days)

Product Line	DoD	VA	Total DoD/VA
Behavioral Health	5.12	319.55	73.69
Medicine	64.50	332.49	122.94
Surgery	43.18	94.28	54.32
Ob/Newborn	54.74	-	42.80
Total	167.54	746.32	293.76

In addition to the workload described above, users in the Puget Sound Market generated 635 direct care Extended Care discharges and approximately 72,000 Extended Care days.

When viewed from the perspective of the *facility* (rather than the market), there were more than 25,000 discharges (including in-migration) and nearly 130,000 days. We see the following breakdown of 2002 inpatient days volume (including in-migration, and post partum and nursery days both counted) and discharges volume. Note that VAMC Seattle manages 47% of the total patient days and Madigan manages 34%. More than 2,400 of Madigan's days and more than 18,000 of the Seattle VA's days came from outside the Puget Sound Market (7,700 of Seattle VA's in-migration were Rehab, 3,500 were Internal Medicine, and 2,300 were Mental Health). Based on recent sharing agreements, future VA American Lake Medicine and Surgery days will be at Madigan.

Table 9: Total Volume by Facility (Regardless of Patient Origin)

Name	Product Line	Inpatient Days	Discharges	Average Length of Stay (ALOS)
VA American Lake	Behavioral Health	7,151	489	14.62
	Medicine (incl. rehab)	7,091	828	8.56*
	Surgery	35	2	17.50
	Subtotal	14,277	1,319	10.82
Madigan AMC	Behavioral Health	1,687	647	2.61
	Medicine (incl. rehab)	16,751	4,392	3.81
	Surgery	12,087	3,159	3.83
	Ob/Newborn	13,032	3,697	3.53
	Subtotal	43,557	11,895	3.66
NH Bremerton	Medicine (incl. rehab)	2,826	1,035	2.73
	Surgery	1,713	569	3.01
	Ob/Newborn	2,838	1,407	2.02
	Subtotal	7,377	3,011	2.45
NH Oak Harbor	Medicine (incl. rehab)	731	387	1.89
	Surgery	426	222	1.92
	Ob/Newborn	1,586	852	1.86

	Subtotal	2,743	1,461	1.88
VAMC Seattle	Behavioral Health	13,680	1,462	9.36
	Medicine (incl. rehab)	35,358	4,275	8.27*
	Surgery	12,107	1,930	6.27
	Subtotal	61,145	7,667	7.98
Puget Sound Total		129,101	25,355	5.09

*When rehab is removed from medicine. American Lake has 738 discharges, 3644 patient days, and a Medicine ALOS of 4.93. VAMC Seattle has 4,069 Medicine discharges, 20,638 patient days, and a Medicine ALOS of 5.07.

2.2.2 Inpatient: Indirect Care

Inpatient indirect care (purchased care/fee-basis care) is measured by Diagnostic Related Group (DRG) for both the DoD and VA. There was a substantial amount of workload coded “000”—which was represented in “Other.”

The DoD is the primary purchaser of indirect care in all Markets. Excluding “Other,” the largest volume of indirect inpatient care is in Medicine and Surgery. When looking at the claims data for DoD, it appears that in the “Other” category, at least an additional 403 discharges were Medicine, 313 were Newborn, 177 were Behavioral Health, and 96 were Surgery (the remaining 4,200 discharges in “Other” could not be further classified). The average length of stay for all indirect care in this Market was 7 days. The indirect inpatient admission use rate per 1,000 enrolled beneficiaries was 27 for DoD and 3 for VA.

The majority of the VA activity was for Priority Group 1, and the majority of inpatient activity for the DoD was Retiree and Retiree Family Members. When the DoD activity is broken down by age, it is revealed that 57% of the discharges were for people over the age of 65—most likely TRICARE for Life enrollees¹⁵.

Table 10: Indirect Care Discharges

Product Line	DoD	VA	Total
Behavioral	109	7	116

2.2.3 Outpatient: Direct Care

Residents of the Puget Sound Market area generated more than 1.7 million direct care visits. This activity includes visits to providers, diagnostic departments (such as lab and x-ray), therapeutic departments (such as radiation therapy, physical therapy), and emergency departments, and includes out-migration. When some specialties such as optometry, dental, audiology, ED, diagnostics and therapeutics are excluded (in order to focus mostly on medical/surgical ambulatory provider activity), there were more than 1.25 million direct care ambulatory visits to providers in Behavioral Health (including substance abuse), Distinctive Programs (such as Underseas Medicine & Flight Medicine), Medical Specialties (including rehab), Ob/Gyn, Surgical Specialties, and Primary Care.

The assessment to follow focuses on the 1.25 million non-diagnostic and non-therapeutic direct visits generated by the users in this Market. Of this subset, 66% (or about 830,000 visits) were DoD and 34% were VA. Sixty-eight percent of Behavioral Health visits were generated by the VA users, while 72% of Primary Care visits were generated by the DoD users.

Table 14: Workload by Product Line

Product Line	DoD	VA	Total	% DoD	% VA
Behavioral Health	63,524	137,519	201,043	32%	68%
Distinctive Programs	20,169	0	20,169	100%	0%
Medical Specialty	78,809	47,270	126,079	63%	37%
Ob/Gyn	80,313	0	80,313	100%	0%
Primary Care	474,090	181,257	655,347	72%	28%
Surgical Specialty	114,464	56,258	170,722	67%	33%
Total	831,369	422,304	1,253,673	66%	34%

As seen in the table below, of the subset of direct care outpatient visits described above generated by Combined Beneficiaries from this market, 52% were for Primary Care (which includes Internal Medicine, Pediatrics, Family Practice, and VA Women's Health), 16% for Behavioral Health, 14% for Surgery/Surgical Specialties, 10% for Medical Specialties, and 6% for Ob/Newborn. Note that the case mix for DoD and VA are somewhat different: 33% of the VA's visits were for Behavioral Health compared to 8% for the DoD.

Table 15: Percent of Total Ambulatory Visits by Product Line and Service (Case Mix)

Product Line	DoD	VA	Combined
Behavioral Health	8%	33%	16%
Distinctive Programs	2%	0%	2%
Medical Specialty	9%	11%	10%
Ob/Gyn	10%	0%	6%
Primary Care	57%	43%	52%
Surgical Specialty	14%	13%	14%
	100%	100%	100%

Direct care use rates per 1,000 enrolled population also show that the VA enrolled population uses the system more than the DoD population does.

Table 16: Direct Care Outpatient Visit Use Rates per 1,000 Enrolled Population

Product Line	DoD	VA	Total DoD/VA
Behavioral Health	203	1,579	504
Distinctive Programs	65	0	51
Medical Specialty	252	543	316
Ob/Gyn	257	0	201
Primary Care	1,519	2,082	1,641
Surgical Specialty	367	646	428

Total	2,663	4,850	3,140
-------	-------	-------	-------

The overall VA direct care use rate and overall direct care DoD use rate are very similar for the Gulf Coast and Puget Sound Markets—but the Hawaii Market is different. In the Hawaii Market, the DoD has a higher rate and the VA has a lower rate than in the other Markets—such that the total outpatient direct care use rates are almost the same for the DoD and VA in the Hawaii Market (about 3,600 per 1,000).

When viewed from the perspective of the *facility* (rather than the market), the facilities in the Puget Sound Market saw more than 1.76 million direct care visits to providers, diagnostics, therapeutics, and emergency departments—including in-migration from other markets. Sixty-five percent of this total activity was provided by DoD facilities and 35% by VA facilities. Thirty-seven of the total outpatient activity supported by the facilities in the market was Primary Care, 17% was Medical Specialty (including Rehab), 15% was Behavioral Health, 13% was “Outpatient Specialty” (a combination of dental, optometry, audiology, geriatrics, emergency department, home care and nutrition). Note this data includes the Troop Medical Clinics and excludes activity at the Shoreline CBOC, since that volume does not appear in the direct care data sets.

The greatest amount of activity was in the Clinical Service Lines of Internal Medicine (360,000 provider, diagnostic, and therapeutic visits), Family Practice (202,500 provider, diagnostic, and therapeutic visits), Mental Health (172,000 provider, diagnostic, and therapeutic visits), and Rehab (152,600 provider, diagnostic, and therapeutic visits). These four Clinical Service Lines represent 50% of the total activity provided by the facilities.

The combined workload of all the facilities in this market is distributed as follows:

Table 17: Activity by Facility

Facility Name	% of workload
Madigan	40%
VAMC Seattle	22%
VA American Lake	13%
NH Bremerton	11%
NH Oak Harbor	8%
McChord	3%
Sub Base Bangor	1%
BMC Everett	1%
Bremerton CBOC	0%

2.2.4 Outpatient: Indirect Care

As an attempt to gauge the amount of care that is provided by non-federal providers, Mitretek Systems analyzed the outpatient indirect care (purchased care/fee-basis care) for the DoD and VA. The DoD activity is mapped to Clinical Service Lines using provider specialty. Thus for the DoD, activity for Internal Medicine can be mapped to Internal Medicine if that was the

provider specialty. The VA data are based on ICD-9 codes¹⁶, so all activity is mapped to a specialty (e.g. someone seeing a doctor for back pain would be mapped to orthopedics—even if the person saw an internal medicine doctor.) Therefore, the level of detail in available in this report *highlights* the levels of activity—but more analysis would be required in order to isolate volume for the purposes of physician planning. The figures below exclude most of the ancillary and non-Physician/Physician Assistant/Nurse Practitioner activity. Note the DoD activity includes managed care support contracts¹⁷ volume.

Table 18: Outpatient Indirect (Purchased Care) Volume by Product Line

Product Line	DoD	VA	Total
Behavioral Health	29,431	10,301	39,732
Medical Specialty	60,192	27,031	87,223
Ob/Gyn	3,748	444	4,192
Outpatient Specialty	46,154	5	46,159
Primary Care	128,001	597	128,598
Surgical Specialty	28,705	11,698	40,403
Total	296,231	50,076	346,307

Some of the highest volume specialties are listed below.

¹⁶ International Classification of Diseases, Ninth Revision

¹⁷ Managed Care Support Contracts (MCSC): risk contracts with civilian provider networks to compliment the healthcare services provided in the Military Treatment Facilities.

Table 19: Outpatient Indirect Care Volume by Select Clinical Service Lines

Clinical Service Line	DoD	VA	Total	DoD % of Total	VA % of Total

None Noted	2,290	1%
Subtotal	298,521	100%
Total	346,307	

Table 21: Outpatient Indirect Care Volumes by Submarket of Users

Submarket	DoD	VA	Total
North Sound	71,479	18,062	89,541
Seattle	34,670	9,786	44,456
South	127,047	13,255	140,302
West Sound	63,035	8,973	72,008
Total	296,231	50,076	346,307

The outpatient indirect care visits use rate per 1,000 enrollees is 948 for DoD and 575 for the VA.

2.3 Supply

2.3.1 Key Productive Spaces

Within a complex hospital, there are only a few areas that generally are considered the key productive spaces. Although the hospital provides a wide range of services, the major drivers of space and capacity tend to be inpatient beds, outpatient exam rooms, operating rooms, and diagnostic imaging equipment. As stated previously, in order to facilitate investigation of sharing opportunities, the two Departments should work diligently to develop standards and definitions for measuring the supply of these spaces and converting them into capacity

Since both the DoD and VA use 85% inpatient bed occupancy as a planning standard for Medical/Surgical beds, and 65% occupancy is a commonly accepted high level critical care standard, this Study did an initial assessment of Medical/Surgical, Psychiatry, and Critical Care bed capacity versus demand using these standards. The market has 398 staffed beds and 415 available beds in these categories. In 2002, the Puget Sound Market had a weighted average staffed-bed occupancy of 64%. This figure is driven downward by very low occupancies at the Naval Hospital Oak Harbor, the Naval Hospital Bremerton, and the Medical/Surgical unit at American Lake VA.

Table 22: Key Productive Spaces

Market	Facility Name	Unit Type	2002 Acute Care Patient Days (Non-OB) Workload	(1) Patient Days Capacity (Staffed Beds) 85%/65%	(1) Patient Days Capacity (Available Beds) 85%/65%	Weighted Occupancy Target	(2) Actual Occupancy (Staffed Beds)	(2) Actual Occupancy (Available Beds)
Puget Sound	American Lake VA	Med/Surg	3,679	7,136	7,136	0.85	44%	44%
	American Lake VA	IP Psychiatry	7,151	8,377	8,377	0.85	73%	73%
	Madigan AMC	Med/Surg	28,867	30,186	33,799	0.81	78%	68%
	Madigan AMC	Inpatient Psychiatry	1,687	1,898	1,898	0.85	58%	58%
	NH Bremerton	Med/Surg	4,545	11,260	11,972	0.83	34%	31%
	NH Oak Harbor	Med/Surg	1,163	7,756	7,756	0.85	13%	13%
	Seattle VA	Med/Surg	32,778	37,668	37,668	0.81	70%	70%
	Seattle VA	Inpatient Psychiatry	13,718	14,892	14,892	0.85	78%	78%
	Puget Sound Total		93,588	119,173	123,498		64%	62%

Notes:

(1) Capacity based on bed counts provided from surveys and site visits. Capacity is bed count x 365 x 85% for Medical/Surgical regular, telemetry, and psych or 65% for Critical Care

(2) Actual occupancy is calculated as 2002 workload/(365*beds). (It does not first reduce capacity by 85% or 65% as in the capacity calculations). Current beds counts (used for "capacity") might be slightly different than bed counts in 2002 (data used for workload). Weighted occupancy target based on % of staffed beds that are regular/telemetry versus critical care. Patient Days exclude OB, Nursery, Rehab, Extended Care, Rehab, SCI. Patient days include migration. Patient Days exclude observation care. Med/Surg is combination regular, telemetry, and critical care.

Tripler staffed ICU beds (5) seemed to be an error, so weighted occupancy target is based on available beds rather than staffed

(3) Tripler VA Psych days are a sum of the days that show up in VA and as Vets (K-61) in the DoD data

Facility Condition

Most of the major hospital buildings were built more than 20 years ago—and many were built more than 50 years ago. At the same time, some of the DoD clinics are very new. Architects and engineers in the study team completed cursory evaluations of the major clinical buildings on most of the sites. Architects scored the inpatient units and ambulatory clinics as either Green or Amber for size and configuration (on a Red/Amber/Green scale—with Green being the best). However, the team observed that most spaces are not ADA compliant. Definitions and data output from these studies are located in the Attachment to this Appendix.

Access

Nearly 90% of DoD enrolled and 70% of the VA enrolled beneficiaries are within 30 minute drives of any facility within their respective system. More than 97% of DoD and more than 83% of VA are within 60 minutes. In all Submarkets except Seattle, 88% or more of the DoD enrollees are within 30 minutes to any DoD facility. In the Seattle Submarket, only 62% of DoD enrollees are within 30 minutes, but 96% are within 60 minutes. The VA has the opposite profile: only in the Seattle Submarket are 90% of the VA enrollees within 30 minutes of any VA facility. The percent drops to 75% in the South, 57% in the West Sound, and only 38% in the North Sound. In the North Sound, only 55% of VA enrollees are within 60 minutes of any VA facility. Not surprisingly, only 63% of VA primary care visits in the overall Market, and only 28% of in the North Sound Submarket and 15% in the West Sound Submarket met the 30 minute standard. Note that the volume in these two markets represents about 22% of all the VA primary care visits in the market. For the DoD, 88% or more of the primary care visits were within 30 minutes of any DoD facility, except for Seattle, where only 51% of visits were within standard.

Given that there are DoD facilities in the North Sound and West Sound Submarkets (Oak Harbor, Everett, Bremerton) and there are VA facilities in the Seattle Submarket, opening access to each other's beneficiaries will improve the access for residents of these Submarkets.

Costs

The total costs that were incurred by DoD and VA in FY02 to fund the care required by the Puget Sound study market beneficiaries represent the current baseline total annual system costs for the Puget Sound market. This is the annual cost required to fund the care provided to the Combined Beneficiary population in the Puget Sound study market and includes all direct care provided directly by DoD and VA facilities as well as indirect care purchased by DoD and VA for these beneficiaries. The baseline cost performance for the Puget Sound study market is illustrated in the table below.

Table 23: Costs in the Puget Sound Market Area

Baseline Total Annual Cost to Deliver Care to DoD and VA Beneficiaries in Reside in the Puget Sound Market (FY2002)			
<i>Cost Figures in Thousands ('000s)</i>	PUGET SOUND COSTS BY AGENCY		
	DoD	VA	Total
In-Market Direct Care Provided

(1) Market enrollees and market users for FY2002 extracted from the Joint Assessment Study Series 4 Database

The Puget Sound study market current baseline annual costs summarized above provides a high level perspective of the total costs for delivering inpatient care and outpatient care, in the aggregate for the entire study market. These inpatient and outpatient costs can also be broken down by Product Line as illustrated in the table below.

Table 24: Costs - Inpatient and Outpatient

The cost data available for the Puget Sound market can be used to calculate the current baseline cost performance for specific sub-segments of each study market, such as select geographic submarkets, for select beneficiary populations, and for select Product or Clinical Service Lines. A Product Line level incremental cost impact analyses will be illustrated in the analysis of the opportunity to rationalize primary care in Puget Sound that follows.

2.4 Findings from the Application of the Study Methodology to the Opportunity to Rationalize Primary Care

Approach to Developing Options

As stated in the introduction, the Mitretek approach focuses initially on the *desirability* of a particular option, specifically on the potential for a rearrangement of health care delivery volumes, capacity and resources to improve access to care and/or to reduce the costs of delivering this care. To identify options, Mitretek developed a 3-step evolutionary rationalization process: rationalize access, rationalize resources, and rationalize access points.

Mitretek recognizes that this approach temporarily suspends consideration of the practical constraints on and real-world barriers to implementing the options that are identified as a result of this evolutionary process—their *feasibility*.

This section of the report provides a detailed example of a specific application of Mitretek’s options development approach and analytical logic to one type of care in one of the three study market areas—rationalizing primary care in Puget Sound. The remainder of this section describes:

- Establishing the Puget Sound primary care baseline
- Estimating the available capacity to provide primary care services
- Identifying and analyzing the options, using the 3-step rationalization process, and
- A summary of Mitretek’s findings and recommendations

Establishing the Puget Sound Primary Care Baseline

A description of the current¹⁸ delivery of primary care services in Puget Sound provides a baseline for the rationalization process described above. The baseline is the result of Mitretek's efforts during the course of the study to identify, collect, analyze and organize disparate data from a variety of DoD and VA sources, and is comprised of data in five areas: current users and their origin; current primary care workload at each facility in the Puget Sound market area; current primary care staff at each facility; a measurement of the current performance of the delivery system for providing reasonable access to these facilities; and a description of the costs of delivering primary care services. These areas are discussed in more detail in the sections that follow.

Users

For the purpose of rationalizing primary care in Puget Sound, facility users are the appropriate baseline for the analysis, as shown in the table below. There are a total of 295,116 facility users, of which 268,879 (91.1%) reside in the Puget Sound market area, with the remainder migrating into the market area to use either DoD or VA health care facilities. The table below shows users who receive *any* health care service from a facility; the methodology does not specifically count the number of users who *only* use primary care services.

Table 25: Current Facility Users, by Submarket and Facility

Submarket	Facility	From Puget Sound Market		In-Migration from Other Markets		Facility Totals

¹⁸ All data and results in this document are for FY02.

Primary Care Workload

The Joint Assessment study methodology uses *visits* as the basic unit of outpatient care services. A visit¹⁹ is defined as one appearance by a unique person at an outpatient care clinic. During the course of one trip to a health care facility, a person may generate multiple visits by going to different clinics (e.g., primary care, radiology, pharmacy, etc.).

Mitretek obtained data on primary care visits to the facilities in Puget Sound from the outpatient direct care standard data files maintained by VA²⁰ and DoD²¹. DoD and VA use different classification schemes in their respective data systems to identify visits of a given type (e.g., primary care, surgical specialty, etc.). To insure that visits of the same type were being counted in the same way, Mitretek developed a “grouper” that organized the data from DoD and VA into a single coherent perspective.²² This approach permitted summarizing visits into broad Product Lines, and more detailed Clinical Service Lines. For rationalizing primary care in Puget Sound, Mitretek summarized the detailed visit data into an overall estimate of total workload, using one Product Line (PL)—Primary Care—and including four Clinical Service Lines (CSL)—Family Practice, Internal Medicine, Pediatrics, and Women’s Health. The first of the two tables below summarizes total primary care workload for both in-market and in-migration; the next table categorizes this total workload by each of the four CSLs.

Table 26: Current Primary Care Workload (Visits), by Submarket and Facility

Submarket	Facility	From Puget Sound Market		In-Migration from Other Markets		Facility Totals

Staff

To estimate the current capacity of each facility to provide primary care services, Mitretek's analytical approach²³ used the number of Full-Time Equivalent (FTE)²⁴ primary care staff at each facility as a critical input variable. Mitretek obtained FTE staffing data for each facility from the relevant DoD and VA²⁵ sources, for each of the four primary care CSLs (i.e., family practice, internal medicine, pediatrics and women's health). Mitretek obtained data for two types of staff—physicians, and non-physician clinicians. These are shown in the table below.

²³ Described briefly elsewhere in this document, and in more detail in the description of the study methodology.

²⁴ An FTE is defined as a work force equivalent of one individual working full-time for a specific period, which may be made up of several part-time individuals or one full-time individual. *Glossary of Health care Terminology (DoD 6015.1-M, January, 1999)*.

²⁵ Account Level Budget Cost Center (ALBCC) data sets for each VA facility, from the VA's Decision Support System (DSS) National Data Extracts.

Table 28: Current FTE Primary Care Staff, by Facility, Provider Type, and Clinical Service Line²⁶

Sub market	Facility	Physicians				Total
		Family Practice	Internal Medicine	Pediatrics	Women's Health

Total		45.4	49.4	8.2	3.4	106.4

Access

²⁶ FTEs for the Okubo Family Practice Clinic and Troop Medical Clinic #1 – Ft. Lewis are reported as part of Madigan AMC. Therefore the workload volumes for these two facilities will be added to the Madigan AMC totals, and these facilities will not be identified separately in the subsequent tables and analysis. Similarly, VA's Seattle CBOC is a contracted facility, staffed by the University of Washington Provider Network (UWPN). Because of the relatively low volume, and the lack of workload and FTE data as detailed as other VA facilities, this facility has also been excluded as having relatively little influence or effect on overall primary care rationalization.

Both DoD and VA use the same performance standard for geographic access to primary care services. Access is considered acceptable if primary care services are located within a 30 minute drive-time distance from a beneficiary's residence. Because specific address information was not available in the data, Mitretek used ZIP code centroids²⁷ as a proxy for location of residence, and conducted drive-time analyses using GIS software. The drive-time analyses identified that proportion of the current in-market primary care visit workload (from Table 3) that met the 30-minute standard; these proportions, expressed as a percent, establish the access performance baseline for each submarket and the Puget Sound market as a whole. The access performance baseline is shown in the table below.²⁸

Table 29: Current Access Performance

Submarket	In-Market PC Volume		Volume Meeting Access Standard		% Volume Meeting Access Standard		
	DoD	VA	DoD	VA	DoD	VA	Combined
North Sound	66,010	19,808	58,177	5,492	88.1%	27.7%	74.2%
Seattle	8,324	56,800	4,263	50,805	51.2%	89.4%	84.6%
South	286,218	80,287	257,444	52,190	89.9%	65.0%	84.5%
West Sound	97,857	20,646	89,357	3,080	91.3%	14.9%	78.0%
Total Market	458,409	177,541	409,241	111,567	89.3%	62.8%	81.9%

Costs

The total costs to provide primary care to the in-market beneficiaries incurred by both DoD and VA in FY02 represents the baseline cost performance for this analysis. This cost analysis identified those costs associated with the current in-Market primary care visit workload reflected in the access performance table above. The cost performance baseline is shown in the table below.

Table 30: Baseline Cost Performance

Submarket	In-Market PC Volume		In-Market PC Costs (\$ in thousands)		Average Total Cost Per Visit		
	DoD	VA	DoD	VA	DoD	VA (1)	Combined
North Sound	66,010	19,808	9,998	3,045	\$ 151	\$ 154	\$ 152
Seattle	8,324	56,800	1,448	8,733	\$ 174	\$ 154	\$ 156
South	286,218	80,287	46,940	12,344	\$ 164	\$ 154	\$ 162
West Sound	97,857	20,646	21,546	3,174	\$ 220	\$ 154	\$ 209
Total Market	458,409	177,541	79,932	27,297	\$ 174	\$ 154	\$ 169

Sources: SADR data by visit for FY2002 for DoD volumes; VA DSS Data Extracts for FY2002 for VA

(1) Total Puget Sound system average costs used for VA by submarket in this analysis

²⁷ A ZIP code's centroid is a point that represents the center of a ZIP code area on a map. The centroid is calculated as the internal balance point, based on the coordinate extremes of the polygon. In cases where the polygon is irregular, the centroid may be adjusted so that ZIP Code labels never fall outside of the polygon.

²⁸ The visit volumes shown in Table 26, while correct for the market as a whole, differ from the submarket totals in Tables 23 and 24. This is because Table 26 reflects patient origin as the basis for the submarket designation, rather than facility location.

Estimating Capacity

To estimate the available capacity to provide primary care services at each facility, Mitretek developed an analytic approach incorporating Capacity Conversion factors²⁹ to the supply of primary care FTE providers. This approach can be summarized by the following equation:

$$\text{Annual Capacity (visits)} = \text{FTE Supply} \times \text{Capacity Conversion Factor} \times \text{Annual Hours}$$

where

- **FTE Supply** = the number of FTEs in a particular Clinical Service Line;
- **Capacity Conversion Factor** = an estimate of the average capacity of one FTE provider in that Clinical Service Line, as the number of visits that can be preformed in one hour; and
- **Annual Hours** is the number of annual hours that one FTE provider is assumed to be available to provide services; this is also the basis for what is considered to be the equivalent of full-time.

To apply this approach, Mitretek adjusted the FTE Supply data shown in Table 5 for each facility. Mitretek also developed estimates of the Capacity Conversion factors for each Clinical Service Line, and a value for Annual Hours for each FTE position.

FTE Supply

The number of FTE physicians and non-clinician providers is contained in the table below. Mitretek adjusted the number of non-clinician providers to account for their lower productivity when compared to physicians; non-clinician providers such as nurse-practitioners and physicians assistants tend to spend more time with a patient during the course of a single visit than do physicians. Based on prior planning experience, Mitretek assumed that non-physician clinicians would be 75% as productive as physicians, and applied this value to the non-physician clinician data. This permitted combining the data for both types of providers into a single primary care "physician-equivalent" FTE estimate for each specialty at each facility, as shown in the table below.

Table 31: Primary Care FTE Physician-Equivalents, by Facility and Clinical Service Line

Sub market	Facility	FTE Physician-Equivalents				Total
		Family Practice	Internal Medicine	Pediatrics	Women's Health	
North Sound	NH Oak Harbor	11.8	0.9	1.6	0	14.3

	NH Bremerton	19.4	4.9	4.1	0	28.4
Total		88.1	97	35.9	4.2	225

²⁹ Details about Capacity Conversion factors can be found in Appendix B.

Capacity Conversion Factors

In developing their overall requirements for clinical staff, DoD and VA—and other health systems—use a variety of methods, separately or in combination, to estimate the productivity of their providers³⁰. For this analysis, Mitretek used one of these methods, which relies on the use of targets for the Capacity Conversion Factor, expressed in average visits per average provider per hour.³¹

Mitretek used data from the Medical Group Management Association (MGMA)³² to develop visit per hour factors for providing primary care services in both academic³³ and non-academic settings. These benchmarks were developed for three medical specialties: Family Practice (without obstetrics (OB)³⁴); Internal Medicine (general) and Pediatrics (general). These align with three of the four Clinical Service Lines; for Women's Health, for which there is no available MGMA data, Mitretek used the benchmark values for Internal Medicine.

Mitretek then developed three additional estimates for the visits per hour Capacity Conversion Factor:

- Federal Composite: Because both the actual workload and staffing data were available, Mitretek developed an estimate of the actual visit per hour performance achieved by both the DoD and VA in each specialty in each market area.³⁵ These estimates were then weighted by the number of visits summarized into a single Federal Composite estimate, reflecting both DoD and VA experience.
- Study Benchmark 1: Mitretek considered that a reasonable target might be somewhat greater than current practice, even if the non-Federal benchmark data from MGMA were considered too high to use as targets. Mitretek defined Study Benchmark 1 as the median between the Federal Composite and the MGMA non-Academic visits per hour values.
- Study Benchmark 2: Similarly, Study Benchmark 2 is defined as the median between the Federal Composite and the MGMA Academic values.

The table below summarizes the five alternative sets of Capacity Conversion Factors, for each specialty, that were developed.

³⁰ More detail about capacity conversion factors can be found in Appendix B.

³¹ A different approach, using the work Relative Value Units (RVUs) recorded for each visit, was partially developed during the study but not applied.

³² MGMA Physician Compensation and Production Survey, 2002.

³³ An academic setting is one associated with a graduate medical education program in one of the primary care Clinical Service Lines/medical specialties. Because of the additional time needed to achieve instructional objectives while engaged in delivering patient care, productivity in terms of visits per hour is typically lower in these settings, compared to non-academic settings.

³⁴ Obstetrics is a separate Product Line in the Joint Assessment study.

³⁵ VA Hawaii data was not incorporated into the development of the Federal Composite, because of its size and relatively anomalous characteristics, when compared to other, larger VA markets.

Table 32: Alternative Capacity Conversion Factors (Visits per Hour), by Specialty

Capacity Conversion Factor Alternatives	Specialty		
	Family Practice (w/o OB)	Internal Medicine	Pediatrics
MGMA Academic	1.29	1.55	1.67
MGMA Non-Academic	2.61	2.04	2.89
Federal Composite	2.64	1.50	1.85
DoD	2.64	1.61	1.85
VA	N/A	1.43	N/A
Study Benchmark 1	2.47	1.77	2.37
Study Benchmark 2	1.81	1.52	1.76

Annual Hours

The definition of full-time equivalency differs between DoD and VA. DoD's MEPRS system calculates and reports FTE by dividing the monthly hours recorded by 168 available hours per month, or an annual FTE basis of 2,016 hours. VA uses a standard federal work year of 2,080 hours, or 40 hours per week for 52 weeks. When an allowance for holidays is taken into account, DoD and VA are using an FTE basis of approximately 2000-2016 hours. In its analysis, Mitretek used the DoD FTE basis of 2,016 hours as a reasonable estimate of full-time equivalency.³⁶

However, Mitretek recognized that not all of these hours could, in reality, be expected to be completely productive with respect to providing primary care services; DoD military providers in particular are expected, as part of their daily routine, to attend to their military-unique duties, which may not be accounted for elsewhere in the MEPRS system. Therefore, Mitretek assumed that 1 hour per day, or 12.5% of a typical 8-hour day, would be non-productive with respect to providing patient care. Applying this 12.5% reduction to the FTE basis of 2,016 hours yields an adjusted value of 1,764 Annual Hours per FTE position.

Mitretek incorporated the FTE Supply data (from Table 25), the alternative Capacity Conversion Factors (from Table 28) and an Annual Hours value of 1764³⁷ into the equation above to produce alternative estimates of the annual primary care capacity at each facility. The results are shown in the table below.

³⁶ It is important to distinguish between the productive capacity of an FTE position, which may by definition be filled by more than one individual, and what a single individual's annual productive work hours might total. This analysis deals with the former, including and summarizing but not explicitly addressing the latter.

³⁷ Detail of annual hours computation can be found in Appendix B.

Table 33: Estimated Annual Primary Care Capacity (Visits), by Facility

Submarket	Facility	Capacity Conversion Factor Alternatives

Based on feedback received on the preliminary results of the primary care rationalization from staff in Puget Sound and other markets, Mitretek determined that the most appropriate capacity estimates to use in the analysis would be a composite of Study Benchmarks 1 & 2—Study Benchmark 3. Study Benchmark 3 was defined as using Study Benchmark 2 for the two primary academic medical centers in Puget Sound—VAMC Seattle, and Madigan Army Medical Center—and using Study Benchmark 1 for all other, non-academic facilities. This determination produces a final baseline estimate of primary care capacity in the market, as shown in the table below.

Table 34: Final Estimated Annual Primary Care Capacity (Visits), by Facility

Analyzing Options

The table below reflects the initial comparison of the baseline values for both primary care visit workload (Table 23) and primary care capacity (Table 30).

Table 35: Initial Comparison

Submarket	Facility	Baseline PC Workload (Visits)	Net Capacity Available/ (Needed)	Current PC Capacity (Visits)
North Sound	NH Oak Harbor	50,774	7,329	58,103
	BMC Everett	17,300	1,871	19,171
Seattle	VAMC Seattle	98,330	24,135	122,465
South	McChord	33,000	1,823	34,823
	American Lake	80,994	(8,514)	72,480
	Madigan AMC (Adjusted)	264,046	20,425	284,471
West Sound	Bremerton OC	4,190	4,990	9,180
	BMC Bangor	20,352	(1,617)	18,735
	NH Bremerton	76,982	39,985	116,967
Total		645,968	90,428	736,396

This comparison provides the basis for the other steps in the analysis of options, as described previously:

1. *Rationalize access* by opening the existing facilities of each system (DoD and VA) to provide health care services to the beneficiaries of the other system;
2. *Rationalize resources* by redistributing volumes and delivery capacity—within geographic access standards—to balance demand and supply at individual facilities, within specific submarkets, and across the market as a whole; and
3. *Rationalize access points*, by opening new and/or closing unneeded locations of service, to further improve access and reduce costs.

Step 1 – Rationalize Access

Rationalizing access is accomplished by opening the facilities of each system to the beneficiaries of the other. The primary care visit workload that is affected by this change is generated from counties that are closer to the newly-opened facility than the facility where this workload was previously accommodated. During the site visits to each market, staff at both DoD and VA facilities reported that the beneficiaries of the “other” system were driving past their facility to receive services from more distant locations.

This step moves these primary care volumes to the nearest facility *with available capacity*, either DoD or VA, in three Clinical Service Lines: Family Practice, Internal Medicine, and Women’s Health. The VA has no capability to provide Pediatric services, so these workload volumes remain at DoD facilities. Additionally, no workload is shifted from VA to DoD TMC³⁸ facilities (e.g. TMC #1 – Ft. Lewis). These actions result in some workload moving from DoD facilities to VA facilities; from VA facilities to DoD facilities, and within DoD or VA, if a different facility is closer than the one currently providing primary care services. Step 1 is implemented by making the following changes, the effect of which are summarized in the table below.

³⁸ A Troop Medical Clinic (TMC) services Active Duty military only. It is a walk-in clinic that performs sick call, provides limited treatment, and refers patients to a health clinic, hospital, or dental clinic, when needed.

- Opening VA facilities to DoD beneficiaries:
 - Moves 4,827 visits generated by DoD beneficiaries residing in the Seattle submarket from Madigan AMC to VAMC Seattle.
 - Moves 821 visits generated in the Seattle submarket from 62nd Medical Group, McChord to VAMC Seattle.
- Opening DoD facilities to VA beneficiaries:
 - Moves 7,603 visits generated by veterans residing in the North Sound submarket (excluding Snohomish county, the most southern) from VAMC Seattle to Naval Hospital Oak Harbor.
 - Moves 153 visits generated by veterans residing in the North Sound submarket (excluding Snohomish county, the most southern) from VAMC American Lake to Naval Hospital Oak Harbor.
 - Moves 5,749 visits generated by veterans residing in the West Sound submarket (excluding Mason county, the most southern) from VAMC American Lake to Naval Hospital Bremerton.
- Realigning within DoD:
 - Moves 124 visits generated by DoD beneficiaries residing in the North Sound submarket (excluding Snohomish county, the most southern) from Madigan AMC to Naval Hospital Oak Harbor.
 - Moves 1,706 visits generated by DoD beneficiaries residing in the West Sound submarket (excluding Mason county, the most southern) from Madigan AMC to Naval Hospital Bremerton.

Table 36: Summary of Step 1 Results – Rationalizing Access

Submarket	Facility	Baseline PC Visits Required	Step 1 Change	Step 1 PC Visits Required	Net Capacity Available/ (Needed)	PC Visit Capacity
North Sound	NH Oak Harbor	50,774	7,880	58,654	(551)	58,103
	BMC Everett	17,300	0	17,300	1,871	19,171
Seattle	VAMC Seattle	98,330	(1,955)	96,375	26,090	122,465

	BMC Bangor	20,352	0	20,352	(1,617)	18,735
	NH Bremerton	76,982	7,455	84,437	32,530	116,967
Total Market		645,968	0	645,968	90,428	736,396

Opening three new VA CBOCs in Bellingham, Centralia, and Olympia improves VA-only Market performance from a baseline of 62.8% to 70.7%. Opening new VA primary care access points, and changing policy to permit access to the closest facility regardless of System, increases overall Market-wide access performance to 97.2%, a significant improvement over 62.8% baseline.

Step 2 – Rationalize Resources

The objective of Step 2 is to shift or reallocate volumes and resources among facilities—maintaining the performance against the 30-minute access standard achieved above—to achieve better operating efficiencies at these facilities, and reduce or eliminate completely the extent to which any facility is over capacity. Step 2 is implemented by making two changes, the effect of which is summarized in the table below.

- Moving the small volume of primary care services provided to veteran beneficiaries at the Bremerton Outpatient Clinic to nearby Naval Hospital Bremerton.
- Closing the Bremerton Outpatient Clinic, and redistributing its provider capacity to VAMC American Lake.³⁹

Table 37: Step 2 Results – Rationalizing Resources

Submarket	Facility	Baseline PC Visits Required	Step 1 Change	Step 1 PC Visits Required	Net Capacity Available/ (Needed)	PC Visit Capacity	Step 2 Capacity Changes
North Sound	NH Oak Harbor	58,654		58,654	(551)	58,103	
	BMC Everett	17,300		17,300	1,871	19,171	
Seattle	VAMC Seattle	96,375		96,375	26,090	122,465	
South	McChord	32,179		32,179	2,644	34,823	
	American Lake	75,092		75,092	6,568	81,660	9,180
	Madigan AMC	257,389		257,389	27,082	284,471	
West Sound	Bremerton OC	4,190	(4,190)	0	(0)	(0)	(9,180)
	BMC Bangor	20,352		20,352	(1,617)	18,735	
	NH Bremerton	84,437	4,190	88,627	28,340	116,967	
Total Market		645,968	0	645,968	90,428	736,396	0

No improvement to market-wide access performance results from Step 2, which was intended to rationalize resources within the access performance achieved by Step 1.

Step 3 – Rationalize Access Points

The objective of Step 3 is to continue to improve the overall performance of the delivery system in the Puget Sound market compared to the access standard, by opening new primary care access points. During its site visit, Mitretek staff learned that the VA was assessing the potential of opening several Community-Based Outpatient Clinics (CBOCs) in the market, in areas that had relatively significant numbers of veteran users residing outside the access standard. In this illustrative example, Step 3 assumes that two of these options will be implemented by making the following changes.

³⁹ The mechanics of redistributing provider capacity from one facility to another may be practically accomplished in a number of ways: simple reassignment of individuals, resignation of providers choosing not to make the move from Bremerton, creating the opportunity for new hiring at American Lake, etc.

- Opening a new CBOC in the North Sound submarket in Bellingham, Washington (Whatcom county). The initial volume for this facility is estimated to be 2,505 visits, all of which are within the 30-minute drive time access standard. This volume is returned from Naval Hospital Bremerton, where it was moved in Step 1.
- Opening a new CBOC in the South submarket, in either Olympia (Thurston county) or Centralia (Lewis county), Washington. The initial volume of the Olympia CBOC is estimated to be 6,433 visits, currently provided by VAMC American Lake, but which are outside the 30-minute drive time access standard. Similarly, the initial volume of the Centralia CBOC is estimated to be 14,559 visits, also currently provided by VAMC American Lake. Workload volumes at VAMC American Lake would be reduced accordingly.
- Provider capacity at the newly-opened CBOCs is achieved by redistributing capacity from VAMC Seattle to the Bellingham CBOC, and from VAMC American Lake to the Olympia and Centralia CBOCs.

However, the initial visit values for the new Olympia and Centralia CBOCs overlap to some degree, i.e., 4,799 of the initial visits in each facility could also go to the other facility and still improve access. Thus, the net number of visits to be accommodated if new access points are opened in both Olympia and Centralia is 16,193 (6,433+14,559-4,799). Initially, it appears that only a portion of this volume could be resourced by redistributing the excess capacity at VAMC American Lake, estimated to be 6,568 visits after completion of Step 2. But, as volumes are moved to the newly-opened CBOCs from VAMC American Lake, additional capacity becomes available on a “pay-as-you-go” basis for potential redistribution and both proposed CBOCs could be opened, with a significant effect on access performance, market-wide. The results of the Step 3 analysis are shown in the table below.

Table 38: Step 3 Results – Rationalizing Access Points

Submarket	Facility	Baseline PC Visits Required	Step 3 Change	Step 3 PC Visits Required	Net Capacity Available/ (Needed)	PC Visit Capacity	Step 3 Capacity Changes
North Sound	NH Oak Harbor	58,654	(2,505)	56,149	1,954	58,103

	BMC Bangor	20,352		20,352	(1,617)	18,735	
	NH Bremerton	88,627		88,627	28,340	116,967	
Total Market		645,968	0	645,968	90,428	736,396	0

Opening three new VA CBOCs in Bellingham, Centralia, and Olympia improves VA-only Market performance from a baseline of 62.8% to 70.7%. Opening new VA primary care access

points, and changing policy to permit access to the closest facility regardless of System, increases overall Market-wide access performance to 97.2%, a significant improvement over 62.8% baseline.

For this analysis of the opportunity to rationalize primary care in the Puget Sound Market, the baseline cost to provide primary care to the in-market beneficiaries incurred by both DoD and VA in FY02 was established as the baseline cost performance for the system under status quo operations. Assuming the implementation of these three sequential steps to rationalize to primary care in the market, the expected incremental operating cost impact on each facility associated with this redistribution of primary care visit volumes that results in a measurable improvement in access described above is projected.

With the data that are available in the study database, the FY02 facility-specific operating costs associated with primary care services at each of the Puget Sound facilities, both the average total cost per visit and the variable cost per visit can be calculated and identified with the specific patient volumes being redistributed. In the cost analysis of this opportunity to rationalize primary care, no assumptions were made as to the ability of the two systems to take advantage of any of the excess provider capacity that might exist and could in fact be leveraged to achieve greater productivity in any of the current service locations. The cost impact illustrated in the table below assumes that the full average variable cost associated with the current visits by location will be redistributed with the visit volumes.

The results of applying this variable cost impact analysis to the three-step approach to redistributing primary care visit workloads to improve access are shown in the table below.

Table 39: Puget Sound Primary Care – Cost Impact of Rationalization

Submarket	Facility	Net Volume Changes by Facility			Incremental Cost Impact of Redistribution of Volumes			
		Baseline PC Visits	Net PC Visit Change After Step 3	Total PC Visits After Step 3	Baseline PC Costs (\$ in thousands)	Baseline Average Variable Cost/Visit (1)	Cost After Step 3 Changes (\$ in thousands)	Step 3 Cost Changes
North Sound	NH OAK HARBOR	50,774	5,375	56,149	\$ 7,690,246	\$ 123	\$ 8,278,250	\$ 588,004

(1) Variable costs per visit from DoD from SADR patient record level cost data; VA average variable cost estimated at 75% of total for this analysis. In this analysis, the full variable cost of the visit at the originating facility is assumed to move with the patient to the new facility. No potential efficiencies from increased utilization of any excess capacity in the system are assumed in this analysis.

(2) Transition costs to develop these new access points are not included in this illustration of operational cost impact of the redistribution of care

(3) Reduction in fixed expenses achievable with the redistribution of Bremerton volumes are not included in this illustration of operational cost impact

Summary of Findings

The analysis of the options reflected in this paper is not intended to be definitive, because the steps involved are very dependent upon changes to current policy—opening access to DoD and VA facilities to the beneficiaries of both delivery systems—that may not occur. Moreover, although the steps are presented in a particular sequence, as a practical matter they are independent, and may be accomplished in any order (e.g., new access points may be opened at any time, with or without rationalizing access via policy changes, or redistributing workload or capacity). Finally, the analysis presented in this paper is based on 2002 data. Given the fluid nature of health care, performing the analysis in a different sequence, under different conditions, would undoubtedly suggest different specific actions than those presented here.

Nevertheless, these illustrative examples provide a basis for some relatively stable findings and conclusions that can be used as a basis for future planning in the Puget Sound market.

Access performance can be improved significantly by opening new access points and redistributing capacity from facilities with surplus capacity. This is true even intra-VA or intra-DoD, if rationalizing access through policy action cannot be accomplished. Opening three new VA CBOCs in Bellingham, Centralia, and Olympia improves VA-only market performance from a baseline of 62.8% to 70.7%. Therefore, Mitretek recommends that the DoD and VA continue to move forward with their planning efforts to open these and other new primary care access points in currently underserved areas.

The analysis in this paper, based on the quantitative workload and capacity information available from both systems, provides a useful “scorecard” and a relatively comprehensive approach for identifying and analyzing care delivery issues in the market, especially but not limited to those involving sharing and collaboration between DoD and VA. In its site visits to Puget Sound and other markets, Mitretek observed that while there were many sharing and collaboration issues and initiatives being considered by both systems, these discussions often occurred without an understanding of the overall range and depth of care delivery in the market. That is, there was often a lack of context for framing the potential improvement represented by a particular initiative, no method to evaluate it, and a lack of methods for comparing it to other, equally intriguing ideas. Mitretek believes that the comprehensive, data-driven, market-wide perspective used in the methods and analysis described in this paper represents a potentially significant contribution to DoD and VA joint planning efforts, for primary care and other categories of health care services.

2.5 Findings from the Assessment Applying the Collaboration Framework

According to the 2002 DoD/VA Sharing Database, there were six master sharing agreements between the VA Puget Sound Health Care System and the military facilities in the region, covering a wide range of clinical and administrative activities. The primary focus of VA and DoD planning during the past year has been devoted to the impending initiative to move the inpatient Medical/Surgical patients from VAMC American Lake to Madigan. Local officials have regarded this as a significant accomplishment of the two departments.

During the second site visit, both the quantitative methods used rationalization of primary care example and the Collaboration Framework were reviewed. In addition, Mitretek presented and

facilitated discussion about more than 50 opportunities for increased DoD/VA collaboration in the Market. These opportunities included ideas that were applicable to all markets (grouped into the Collaboration Framework) as well as ideas specific to the Puget Sound Market and/or specific to certain facilities in the Market.

One of the tools in the Collaboration Framework is a Relationship Grid. Along a continuum of Separate, Coordinated, Connected, Integrated, and Consolidated most of the relationships among the major hospitals in the Market are either Separate or Coordinated. In terms of Clinical Workload, VA and Madigan would be considered Coordinated since there is regular communication between the two hospitals. However, in the same category, Mitretek found the relationships between the VA and the two Naval Hospitals (Bremerton and Oak Harbor) to be less well-developed (these would be rated as Separate) due to the low volume referrals between them. In terms of Staffing, VA and Madigan are also considered Coordinated since there is some sharing where duplication exists and some cross staffing support to balance peak workloads. In terms of Facilities, all of the hospitals are currently rated as Separate since they are distant from each other and cannot share physical space; this reinforces the idea of moving primary care volumes among the facilities of each system. VA and Madigan are also more well-developed than VA-Bremerton/Oak Harbor in other domains, rating as Coordinated in Information Management/Information Technology, Governance and Logistics.

The feedback sessions during the second site visit affirmed the use of the collaboration framework as a useful way to look at the relationship between VA and DoD within the market. The framework highlights the many dimensions of collaboration and can be used as a frame of reference in future planning.

Table 40: VAMC & MAMC Relationship Grid

Domain	Separate	Coordinated	Connected	Integrated	Consolidated
Clinical Workload	Insignificant referrals	Regular communication between VA and Madigan	High numbers of referrals	Significant number of referrals between American Lake and Madigan	Most referrals sent to all patients
Facilities	Distant	Some sharing where duplication exists	Projects & facilities come from master planning	Many departments share space	Single facility or set of facilities
Staffing	Distinct	Support in peaks and valleys	Joint staff planning	Multiple examples of single/joint staffing	Single staffing
Business Processes	Different	Reduce barriers	Work flows understood & acted on	Transparent	Unified processes
Management/ Governance	No Relation	Joint planning sessions	Overlap of key functions	Overlap of key functions	One governing management structure
IM/IT	Separate systems	Evidence of "E" exchange of info	Moving toward systems interface	Complete interoperability	Unified systems
Logistics	Little if any exchange	Borrowing, bartering and contractual exchange	Mutual examination of best pricing and service	Selective joint contracting of major areas of procurement	Unified procurement
Education & Training	Distinct	Selective exchange of methods	Frequent use of joint programs and curriculum	Most programs and curriculum are same/similar	Unified programs
Research	Distinct	Selective exchange of protocols	Joint planning and review of many studies	Significant overlap of protocols and review	Unified research

Table 41: VAMC & NH Bremerton Relationship Grid

Domain	Separate	Coordinated	Connected	Integrated	Consolidated
Clinical Workload	Insignificant referrals	Regular communications	High numbers of referrals	Significant number of referrals as one	Protocol-driven placement of all patients
Facilities	Distant	Some sharing where duplication exists	Projects & facilities come from master planning	Many departments share space	One facility or set of facilities
Staffing	Distinct	Support in peaks and valleys	Joint staff planning	Multiple examples of single/joint staffing	Single staffing
Business Processes	Different	Reduce barriers	Work flows understood & acted on	Transparent	Single system
Management/ Governance	No Relation	Joint planning sessions	Overlap of key functions	Overlap of key functions	One governance & management structure
IMIT	Separate systems	Evidence of "E" exchange of info	Moving toward systems interface	Complete interoperability	One system
Logistics	Little if any exchange	Borrowing, bartering and contractual exchange	Mutual examination of best pricing and service	Selective joint contracting of major areas of procurement	One supply chain
Education & Training	Distinct	Selective exchange of methods	Frequent use of joint programs and curriculum	Most programs and curriculum are same/similar	Unified program
Research	Distinct	Selective exchange of protocols	Joint planning and review of many studies	Significant overlap of protocols and review	Unified program

2.6 Recommendations for the Puget Sound Market

The opportunity to rationalize primary care analyzed in the application of this Study Methodology provides a basis for some relatively stable recommendations that can be used as a basis for future planning in the Puget Sound Market (and potentially elsewhere).

Mitretek recommends that the VA and DoD continue to move forward with their planning efforts to open new primary care access points in geographic areas that are in currently underserved.

The analysis in this Report, based on the quantitative workload and capacity information available from both systems, provides a useful “scorecard” and a relatively comprehensive approach for identifying and analyzing care delivery issues in the Market, especially but not limited to those involving sharing and collaboration between VA and DoD. In its site visits to Puget Sound and other Markets, Mitretek observed that while there were many sharing and collaboration issues and initiatives being considered by both systems, these discussions often occurred without an understanding of the overall range and depth of care delivery in the Market. That is, there was often a lack of context for framing the potential improvement represented by a particular initiative, no method to evaluate it, and a lack of methods for comparing it to other, equally intriguing ideas. Mitretek believes that the comprehensive, data-driven, Market-wide perspective used in the methods and analysis described in this paper represents a potentially significant contribution to DoD and VA joint planning efforts, for primary care and other categories of health care services.

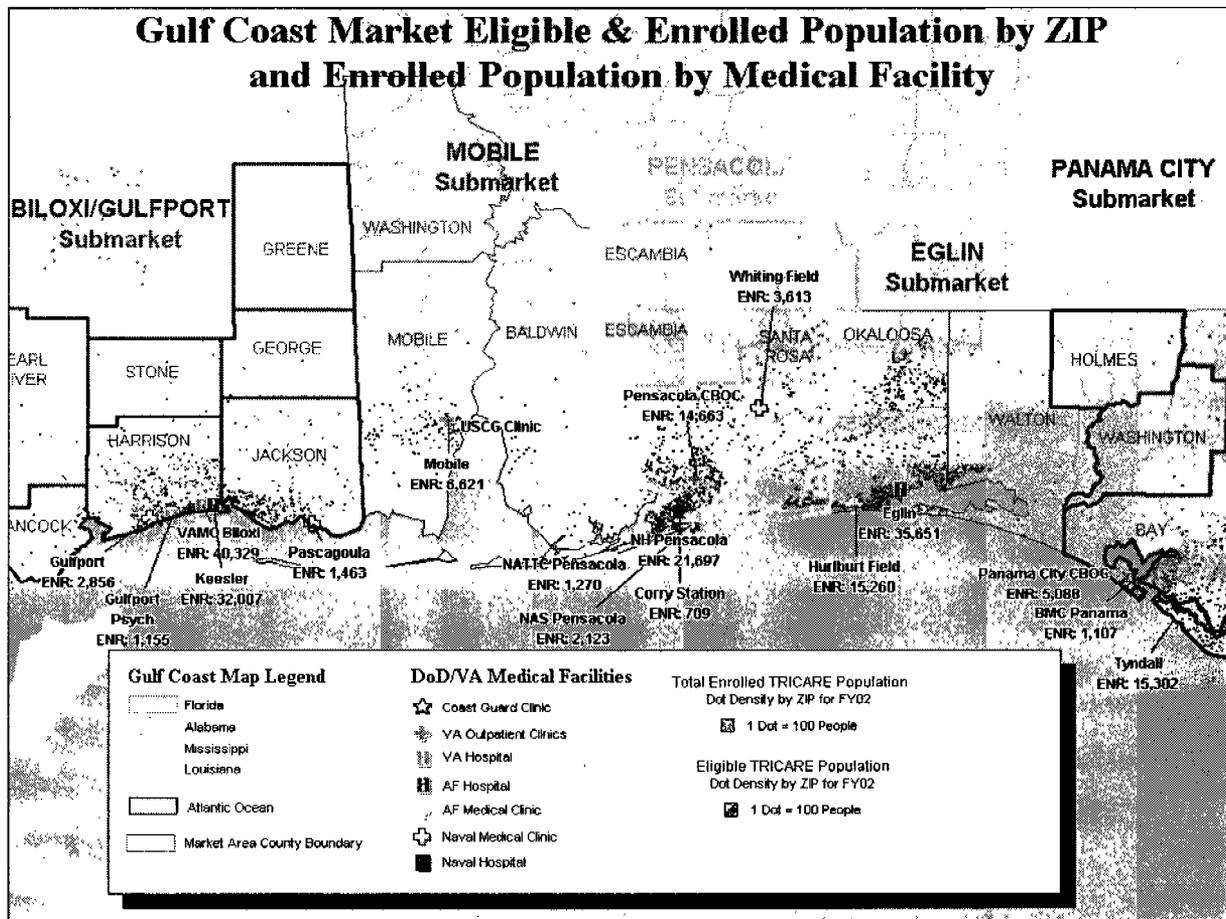

Mitretek recommends use of the Collaboration Framework to assist the organizations as they consider, plan for, and act on most of the identified opportunities

These opportunities identify the present avenues for improving care delivery to military and veteran beneficiaries residing in the Market. All such actions should proceed from a deliberate joint planning process.

**GULF COAST
MARKET
ASSESSMENT**

3 MARKET ASSESSMENT- GULF COAST MARKET

A goal of this study is to view the market area from the perspective of the Combined Beneficiary⁴⁰, rather than from the perspective of the System delivering the care. Thus, this market has been divided into five Submarkets—based on geography rather than existing care delivery models. The Submarkets are Biloxi/Gulfport, Eglin, Mobile, Panama City and Pensacola. The Biloxi/Gulfport Submarket is comprised of George, Greene, Hancock, Harrison, Jackson, Pearl River, and Stone counties. The Eglin Submarket is comprised of Okaloosa and Walton Counties. The Mobile Submarket contains Baldwin, Mobile, and Washington, AL counties. Panama City Submarket is made up on Bay, Holmes, and Washington, FL counties. As shown in the map below, the Pensacola Submarket contains Escambia, AL, Escambia, FL and Santa Rosa counties.

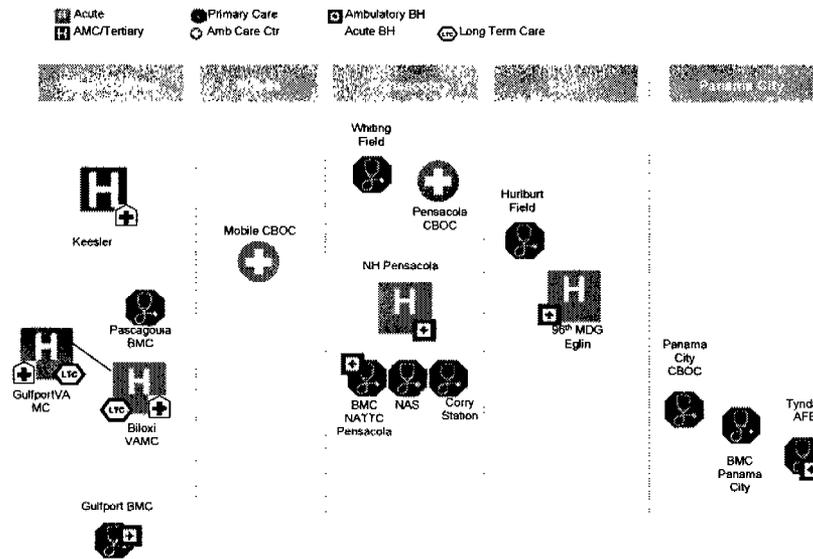

The Gulf Coast Market area contains 18 DoD and VA medical treatment facilities—of which 5 are hospitals and 13 are outpatient centers (including one active-duty-only TMC at Eglin). The facilities are distributed into the following counties and Submarkets:

⁴⁰ See the Introduction of this Appendix for a definition of Combined Beneficiary.

Table 43: Study Market Area Definition for Gulf Coast

Submarket	County	DoD Facilities	VA Facilities
Biloxi/Gulfport	George Greene Hancock Harrison Jackson Pearl River Stone	<ul style="list-style-type: none"> – Keesler Medical Center (Keesler) – Naval Branch Medical Clinic Pascagoula (BMC Pascagoula) – Branch Medical Clinic Gulfport (BMC Gulfport) 	<ul style="list-style-type: none"> – VA Gulf Coast Veterans Health Care System - Biloxi Division (VAMC Biloxi) – VA Gulf Coast Veterans Health Care System - Gulfport Division (VA Gulfport)
Mobile	Baldwin Mobile Washington, AL		<ul style="list-style-type: none"> – Mobile CBOC
Eglin	Okaloosa Walton	<ul style="list-style-type: none"> – 96th Medical Group, Eglin AFB (Eglin) – 16th MG, Hurlburt Field – TMC Eglin AFB 	
Panama City	Bay Holmes Washington, FL	<ul style="list-style-type: none"> – BMC Panama City – 325th Medical Group, Tyndall AFB (Tyndall) 	<ul style="list-style-type: none"> – Panama City CBOC
Pensacola	Escambia, AL Escambia, FL Santa Rosa	<ul style="list-style-type: none"> – NH Pensacola – NAS Pensacola – NATTC Pensacola – Naval Tech Training Center Corry Station (Corry Station) – Whiting Field 	<ul style="list-style-type: none"> – Pensacola CBOC

Another way to view the Submarkets and their facilities is illustrated below.

The Gulf Coast Market area is unique in that it encompasses a very large geographic area, some parts of which are sparsely populated. The Gulf of Mexico dominates the geography—resulting in a 240-mile linear distance between the two ends of the Market. Further, the area is a popular

location for DoD retirees (particularly the Florida panhandle)—thus there are a high number of “dual eligible” of the DoD and VA.

The topography and geography of the Market makes providing adequate access to care difficult. Since the Market area is so large and long, determining whether to provide services (particularly inpatient services) in a specific location is a challenge. In many individual locations (especially east of Biloxi/Gulfport) each System has a population that is important to serve—but there might not be enough population to warrant an individual hospital for each System. At the same time, in the Biloxi/Gulfport Submarket, there are two major hospital facilities adjacent to each other in Biloxi—with a third nearby in Gulfport. In the Eastern Submarkets, where there are only DoD inpatient facilities, and in the Mobile Submarket where there is only a VA outpatient center, access to each other’s facilities has the potential to improve access for beneficiaries. In the Biloxi/Gulfport Submarket, where there are three inpatient hospitals—all with significant capital requirements-- there is an opportunity to simultaneously reduce long-term capital costs and to provide an enriched GME experience through opening access and combining some of the services of these facilities.

3.1 Populations

3.1.1 Eligible Population

The Gulf Coast Market Area has approximately 509,000 eligible Combined Beneficiaries—approximately 55,000 of which are “dual eligible” for both DoD and VA benefits. This population represents three states and 18 counties in the Gulf Coast area, and the eligible population is about evenly split between DoD and VA. The Biloxi/Gulfport Submarket and the Eglin Submarket each make up about 22% of the eligible population. The Pensacola Submarket represents 30% of the eligibles, the Mobile Submarket represents about 15% and the Panama City Submarket represents 11% of the eligible population.

Specifically, about 20% of the eligible population (68% of which are DoD) live in Okaloosa County in the Eglin Submarket, and another 20% (55% DoD) live in Escambia County, FL, in the Pensacola Submarket. Another 12% lives in Harrison County (58% DoD) in the Biloxi/Gulfport Submarket and 10% lives in Mobile (76% VA).

In the Gulf Coast Market overall, 21% of the DoD 258,000 eligible population are Active Duty, 26% are Active Duty Family Members, 21% are Retiree, 31% are Retiree Family Members. Of the 251,000 eligible Veterans, 53% are Priority Group 8 and 25% are Priority Group 5. The rest are spread with about 3-6% each in the other Priority Groups.

3.1.2 Enrolled Population

The 358,000 combined DoD/VA enrollees equaled 70% of the eligible population. Specifically, enrolled Veterans (62,000) equaled about 25% (62,000) of eligible Veterans. The number of enrolled DoD exceeded the number of the eligible DoD. (Note that for DoD there are actually more enrolled than eligible—because DoD beneficiaries can be enrolled in a facility outside the Market area). VA enrollment as a percent of eligible ranges from a low of 18% in Baldwin County (Mobile Submarket) to a high of 39% in Harrison County (Biloxi/Gulfport Submarket).

Below are tables that display the enrolled population broken down by Priority Group and Beneficiary Category.

Table 44: VA Enrolled Population by Priority Group

1	2	3	4	5	6	7	8
9,259	6,094	11,039	1,779	20,562	1,069	709	11,294
15.0%	9.9%	17.9%	2.9%	33.3%	1.7%	1.1%	18.3%

Table 45: DoD Enrolled Population Beneficiary Category

Active Duty	Active Duty Family Members	Retiree	Retiree Family Members
74,134	128,523	34,179	59,396
25.0%	43.4%	11.5%	20.1%

3.1.3 Users

The Combined DoD/VA users of either the direct or indirect care system equaled 92% of the combined enrolled population, net of dual users. The number of unique DoD users of either the direct or indirect system (358,000 unique users) exceeded the number of DoD enrolled, while the 48,000 unique VA users equaled 77% of the VA enrolled. Indirect care is Purchased Care for the DoD and Fee Basis Care for the VA.

In the DoD, 48% of the total users accessed indirect care. In the VA only 13% used indirect care. For *direct* care, 7% of users were dual users (used both systems). 7% of users were dual users in the Biloxi/Gulfport Submarket, the Eglin Submarket, and the Panama City Submarket, in Pensacola it was 7%, and in Mobile 4%.

3.2 Workload

3.2.1 Inpatient: Direct Care

Residents of the Gulf Coast Market area generated about 17,850 discharges and 93,200 inpatient days of direct care in Medicine (including Rehab), Surgery, Behavioral Health (including Substance Abuse), and Ob/Newborn (Post Partum and Nursery days both counted). These volumes include out-migration, but exclude indirect care and extended care.

Direct care discharges for this type of care varied by Beneficiary Group: for the VA, 26% of discharges were for Priority Group 1, and 38% were for Priority Group 5. Priority Group 4 generated 17% of the discharges, while Priority Groups 2 and 3 generated 5% and 9% respectively. For the DoD, 44% of discharges were consumed by Active Duty Family Members, 19% by Retirees, and 21% for Retiree Family Members. As in Puget Sound, only 15% of discharges were generated by Active Duty.

Seventy-nine percent of the discharges and 43% of the days were DoD. Twenty-one percent of the discharges and 57% of the days were VA. Eighty-two percent of the Surgery discharges and 69% of the direct care inpatient days were generated by the DoD. Seventy-three percent of the Medicine discharges and 37% of the days were for the DoD, whereas 72% of the Behavioral Health discharges and 96% of the direct care days were for the VA. Note that more than 11,000

of the Medicine days (nearly 50%) for the VA are Rehab Medicine, and 1,600 of the Medicine Days (about 12%) for the DoD are Pediatrics. The difference in proportion of discharges and days is due to length of stay—as seen in the table below.

Table 46: Average Length of Stay by Product Line

Product Line	DoD	VA	Combined
Behavioral Health	2.6	23.9	18.0
Medicine (incl. rehab)	2.7	12.4	5.3
Surgery	3.4	6.9	4.1
Ob/Newborn	2.6		2.6

(Note: VA Medicine includes Rehab—which increases the average length of stay (ALOS) dramatically. There were 263 VA Rehab discharges with an ALOS of 44 days. Without rehab, the VA Medicine ALOS is 7 days.)

Table 47: Inpatient Days by Product Line

Product Line	DoD	VA	Total	% DoD	% VA
Behavioral Health	1,036	24,796	25,832	4%	96%
Medicine	13,644	23,126	36,770	37%	63%
Surgery	12,044	5,334	17,378	69%	31%
Ob/Newborn	13,216		13,216	100%	0%
Total	39,940	53,256	93,196	43%	57%

As seen in the table below, of the direct care inpatient days generated by Combined Beneficiaries from this market, 39% were for Medicine (including rehab), 28% for Behavioral Health, 19% for Surgery and 14% for Ob/Newborn (including both Post-Partum and Nursery). Note that the case mix for DoD and VA are quite different—especially for Behavioral Health and Surgery: 47% of the VA’s patient days were for Behavioral Health and only 10% were for Surgery. This compares to only 3% and 30% respectively for the DoD.

Table 48: Percent of Total Inpatient Days by Product Line and Service (Case Mix)

Product Line	DoD	VA	Combined
Behavioral Health	3%	47%	28%
Medicine	34%	43%	39%
Surgery	30%	10%	19%
Ob/Newborn	33%	0%	14%
Total	100%	100%	100%

Based on the enrolled populations of the two systems, there are the following *direct care* use-rates per 1,000 enrolled. This means these use rates exclude the purchased care/fee basis care—so it reflects only the use of the MTFs and VA facilities. In the DoD, 48% of the total number of users in this market accessed the purchased care system—and those users’ activity is not reflected in these use rates. (In the VA, 13% of total users accessed fee-basis care). Nonetheless, the table below shows clearly the difference in patient profile between the DoD and VA. Note that the inpatient days for the VA are skewed due to the high number of behavioral health days and the fact that Rehab is included in Medicine.

Table 49: Direct Use Rates per 1,000 Enrolled Population (in Bed Days)

Product Line	DoD	VA	Combined
Behavioral Health	3.50	401.20	72.15
Medicine	46.06	374.18	102.70
Surgery	40.66	86.30	48.54
Ob/Newborn	44.61	-	36.91
Total	134.83	861.68	260.30

In addition to the workload noted above, the users in the Gulf Coast Market generated approximately 540 direct care Extended Care discharges and approximately 76,000 Extended Care days.

When viewed from the perspective of the *facility* (rather than the market), there were nearly 18,000 discharges (including in-migration) and roughly 89,500 patient days (double-counting mothers and babies). Note that in 2002, Biloxi VAMC had an inpatient substance abuse program, which has since been closed. Also, in 2002, Keesler still had its inpatient psychiatry program.

Biloxi VAMC manages 30% of the total patient days (although only 22% if Rehab is excluded) and Keesler and Gulfport each manage about 22% of the days. Eglin manages 11% of the days. More than 2,200 of Keesler's days and about 2,000 of the Biloxi VAMC's days came from outside the Gulf Coast Market. Based on recent sharing agreements, future Keesler Psychiatry days will be at Gulfport.

Table 50: Total Volume by Facility (Regardless of Patient Origin)

Facility Name	Product Line	Inpatient Days	Discharges	Average Length of Stay
Keesler	Behavioral Health	1,277	550	2.32
	Medicine (incl. rehab)	6,549	1,950	3.36
	Surgery	7,808	1,767	4.42
	Ob/Newborn	6,183	1,800	3.44

Biloxi VAMC	Behavioral Health	4,334	223	19.43
	Medicine (incl. rehab)	20,571	1,604	12.82*
	Surgery	2,916	498	5.86
	Subtotal	27,821	2,325	11.97
Gulfport	Behavioral Health	20,381	810	25.16
	Medicine	165	8	20.63
	Surgery	11	1	11.00
	Subtotal	20,557	819	25.10
NH Pensacola	Medicine (incl. rehab)	3,789	1,482	2.56
	Surgery	2,261	772	2.93
	Ob/Newborn	3,143	1,350	2.33

	Subtotal	9,193	3,604	2.55
Gulf Coast Total		89,548	17,887	5.01

*Medicine ALOS reduces to 7.5 days when rehab is excluded from Medicine

3.2.2 Inpatient: Indirect Care

Inpatient indirect care (purchased care/fee-basis care) is measured by DRG for both the DoD and VA. There was a substantial amount of workload coded “000,” which was expressed in “Other.”

The DoD is the primary purchaser of indirect care in all Markets. Excluding “Other,” the largest volume of indirect inpatient care is in Medicine and Surgery. When looking at the claims data for DoD it appears that in the “Other” category, at least an additional 691 discharges were Medicine, 422 were Newborn, 300 were Behavioral Health, and 221 were Surgery (the remaining 7,700 discharges in “Other” could not be further classified). The average length of stay for all indirect care in this Market was 6.4 days. The indirect inpatient admission use rate per 1,000 enrolled beneficiaries was 52 for DoD and 3.6 for VA. This is the highest indirect DoD use rate of the three Markets.

The majority of the VA activity was for Priority Groups 1 and 5, and the majority of inpatient activity for the DoD was Retirees and Retiree Family Members. When the DoD activity is broken down by age, it is revealed that 51% of the discharges were for people over the age of 65—most likely TRICARE for Life enrollees.

A more detailed description of inpatient indirect care in this Market is included in a later section entitled “Findings from the Application of the Study Methodology to Examine the Opportunity to Consolidate Inpatient Care in Biloxi/Gulfport”

Table 51: Indirect Care Discharges

3.2.3 Outpatient: Direct Care

Residents of the Gulf Coast Market area generated more than 1.4 million direct care visits. This activity includes visits to providers, diagnostic departments (such as lab and x-ray), therapeutic departments (such as radiation therapy, physical therapy), and emergency departments, and includes out-migration. When some specialties such as optometry, dental, audiology, ED, diagnostics and therapeutics were excluded (in order to focus mostly on medical/surgical ambulatory provider activity), there were more than 1 million direct care ambulatory visits to providers in Behavioral Health (including substance abuse), “Distinctive Programs” (such as Undersea Medicine & Flight Medicine), Medical Specialties (including rehab), OB/Gyn, Surgical Specialties, and Primary Care.

The following observations focus on the 1 million non-diagnostic and non-therapeutic visits. Of this, 73% (or about 774,000 visits) were DoD and 27% were VA. 63% of Behavioral Health visits were generated by the VA users, while 77% of Primary Care and 68% of the Surgery visits were generated by the DoD users.

Table 55: Outpatient Direct Care Workload by Product Line

Product Line	DoD	VA	Combined	% DoD	% VA
Behavioral Health	35,442	61,245	96,687	37%	63%
Distinctive Programs	58,625	0	58,625	100%	0%
Medical Specialty	57,067	39,236	96,303	59%	41%
Ob/Gyn	60,163	0	60,163	100%	0%
Primary Care	474,846	141,190	616,036	77%	23%
Surgical Specialty	87,715	40,701	128,416	68%	32%
Total	773,858	282,372	1,056,230	73%	27%

As seen in the table below, of the subset of direct care outpatient visits described above generated by Combined Beneficiaries from this market, 58% were for Primary Care (which includes Internal Medicine, Pediatrics, Family Practice, and VA Women's Health), 9% for Behavioral Health, 12% for Surgery/Surgical Specialties, 9% for Medical Specialties, and 6% for Ob/Newborn. Note that the case mix DoD and VA are somewhat different: 22% of the VA's visits were for Behavioral Health compared to 5% for the DoD. Also, the VA had a higher percentage of its direct care visits from this market for Medical and Surgical Specialties and lower percentage for Primary Care than the DoD.

Table 56: Direct Care Outpatient Service Mix

Product Line	DoD	VA	Combined
Behavioral Health	5%	22%	9%
Distinctive Programs	8%	0%	6%
Medical Specialty	7%	14%	9%
Ob/Gyn	8%	0%	6%
Primary Care	61%	50%	58%
Surgical Specialty	11%	14%	12%
Total	100%	100%	100%

Direct care use rates per 1,000 enrolled population also show that the VA enrolled population uses the system more than does the DoD. These use rates exclude purchased care/fee basis care.

Table 57: Direct Care Outpatient Use Rates per 1,000 Enrollees

Product Line	DoD	VA	Total DoD/VA
Behavioral Health	120	991	270
Distinctive Programs	198		164
Medical Specialty	193	635	269
Ob/Gyn	203	-	168
Primary Care	1,603	2,284	1,721
Surgical Specialty	296	659	359
Total	2,612	4,569	2,950

The overall VA direct care use rate and overall direct care DoD use rate are very similar for the Gulf Coast and Puget Sound Markets—but the Hawaii Market is different. In the Hawaii Market, the DoD has a higher rate and the VA has a lower rate than in the other Markets—such that the total outpatient direct care use rates are almost the same for the DoD and VA in the Hawaii Market (about 3,600 per 1,000). This is most likely related to the use of indirect care: the percent of DoD users who accessed indirect care was lower in the Hawaii Market than the

other two Markets. Likewise, the percent of VA users who accessed fee basis care was higher in Hawaii.

When viewed from the perspective of the *facility* (rather than the market), the facilities in the Gulf Coast Market saw more than 1.4 million direct care visits to providers, diagnostics, therapeutics, and emergency departments—including in-migration from other markets. 71% of this total activity was provided by DoD facilities and 29% by VA facilities. 44% of the total outpatient activity supported by the facilities in the market was Primary Care, 17% was Medical Specialty (including Rehab), 9% was Behavioral Health, 9% was Surgical Specialty, and 12% was “Outpatient Specialty” (a combination of dental, optometry, audiology, geriatrics, emergency department, home care, and nutrition).

The greatest amount of activity was found in the Clinical Service Lines of Internal Medicine (444,000 provider, diagnostic, and therapeutic visits), Family Practice (111,000 provider, diagnostic, and therapeutic visits), Mental Health (110,000 provider, diagnostic, and therapeutic visits), and Rehab (139,000 provider, diagnostic, and therapeutic visits). These four Clinical Service Lines represent more than 57% of the total activity provided by the facilities.

The combined workload of all the facilities in this Market is distributed as follows:

Table 58: Activity by Facility

Facility Name	% of Total
Keesler	19%
Eglin	17%
NH Pensacola	14%
Biloxi VAMC	13%
Tyndall	6%
Pensacola CBOC	6%
VA Gulfport	5%
Hurlburt	4%
Corry Station	3%
Mobile	3%
NAS-Pensacola	3%
BMC Gulfport	2%
Panama City CBOC	2%
NATTC Pensacola	1%
BMC Pascagoula	1%
Whiting Field	1%
BMC Panama City	0%

3.2.4 Outpatient: Indirect Care

As an attempt to gauge the amount of care that is provided by non-federal providers, Mitretek Systems analyzed the outpatient indirect care (purchased care/fee-basis care) for the DoD and VA. The DoD activity is mapped to Clinical Service Lines using “provider specialty.” Thus for the DoD, activity for Internal Medicine can be mapped to Internal Medicine if that was the provider specialty. The VA data are based on ICD-9, so all activity is mapped to a specialty

(e.g., someone seeing a doctor for back pain would be mapped to orthopedics—even if the person saw an internal medicine doctor.) Therefore, the level of detail in available in this report *highlights* the levels of activity—but more analysis would be required in order to isolate volume for the purposes of physician planning. The figures below exclude most of the ancillary and non-MD/PA/NP activity. Note that the DoD activity includes managed care support contracts and TRICARE for Life volume.

Table 59: Outpatient Purchased Care Volume by Product Line

Product Line	DoD	VA	Total
Behavioral Health	69,174	1,373	70,547
Medical Specialty	167,302	18,348	185,650
Ob/Gyn	13,959	45	14,004
Outpatient Specialty	38,261	18	38,279
Primary Care	284,785	284	285,069
Surgical Specialty	109,908	12,525	122,433
Total	683,389	32,593	715,982

When broken down by Clinical Service Line, some of the highest volume services include:

Table 60: Outpatient Purchased Care Volume By Select Clinical Service Lines

Product Line	DoD	VA	Total	DoD % of Total	VA % of Total
Cardiology	35,250	2,066	37,316	94%	6%
Orthopedics	25,568	2,782	28,350	90%	10%
Urology	24,517	3,372	27,889	88%	12%
Neurology	21,487	2,748	24,235	89%	11%
Immunology	18,424	0	18,424	100%	0%
Gynecology	13,946	0	13,946	100%	0%
Gastroenterology	11,407	293	11,700	97%	3%

Table 61: Outpatient Purchased Care by Beneficiary Group

Beneficiary Group	Volume	% of respective volume
None noted	658	2%
PG 1	16,102	52%
PG 2	2,283	7%
PG 3	2,511	8%
PG 4	3,582	11%
PG 5	4,989	16%
PG 6	54	0%
PG 7	55	0%
PG 8	990	3%

Active Duty	21,031	3%
Active Duty Family Member	137,124	20%
Retiree	205,595	30%
Retiree Family Member	319,639	47%
None noted	1,369	0%
DoD TOTAL		100%

Total	715,982	
--------------	----------------	--

Table 62: Outpatient Indirect Care by Submarket of the Users

Submarket	DoD	VA	Total
Biloxi/Gulfport	94,416	8,180	102,596
Eglin	198,185	5,114	203,299
Mobile	64,398	6,331	70,729
Panama City	108,037	5,627	113,664
Pensacola	218,353	7,341	225,694
Total	683,389	32,593	715,982

The outpatient indirect care visits use rate per 1,000 enrollees is 2,306 for DoD and 527 for the VA. The DoD use rate is more than twice as high as in the other two Markets.

3.3 Supply

3.3.1 Key Productive Spaces

Within a complex hospital, there are only a few areas that generally are considered key productive spaces. Although the hospital provides a wide range of services, the major drivers of space and capacity tend to be inpatient beds, outpatient exam rooms, operating rooms, and diagnostic imaging equipment. As stated previously, in order to facilitate investigation of sharing opportunities, the two Departments should work diligently to develop standards and definitions for measuring the supply of these spaces and converting them into capacity

Since both the DoD and VA use 85% inpatient bed occupancy as a planning standard for Medical/Surgical beds, and 65% occupancy is a commonly accepted high level critical care standard, this Study did an initial assessment of Medical/Surgical, Psychiatry, and Critical Care bed capacity versus demand. The market has 281 staffed beds and 344 available beds in these categories. In 2002 the Gulf Coast Market had a weighted average staffed-bed occupancy of 59%.

This Study also completed a detailed analysis of the impact of re-allocating Medical/Surgical care in this Market. That example is described in a later section of this appendix.

Table 63: Key Productive Spaces

Market	Facility Name	Unit Type	2002 Acute Care Patient Days (Non-OB) Workload	(1)Patient Days Capacity (Staffed Beds) 85%/65%	(1) Patient Days Capacity (Available Beds) 85%/65%	Weighted Occupancy Target	(2)Actual Occupancy (Staffed Beds)	(2) Actual Occupancy (Available Beds)
Gulf Coast	Keesler Med Ctr	Med/Surg	14,357	22,630	24,765	0.82	52%	46%
	Eglin AFB	Med/Surg	5,946	7,464	13,231	0.82	65%	36%
	Biloxi VA	Med/Surg	13,607	14,545	14,545	0.81	76%	76%
	Gulfport VA	Inpatient Psychiatry	20,381	27,612	38,161	0.85	63%	45%
	NII Pensacola	Med/Surg	6,050	12,447	12,447	0.81	39%	39%
	Gulf Coast Total		60,341	84,698	103,149		59%	48%

Notes:

- (1) Capacity based on bed counts provided from surveys and site visits. Capacity is bed count x 365 x 85% for Medical/Surgical regular, telemetry, and psych or 65% for Critical Care
- (2) Actual occupancy is calculated as 2002 workload/(365*beds). (It does not first reduce capacity by 85% or 65% as in the capacity calculations). Current beds counts (used for "capacity") might be slightly different than bed counts in 2002 (data used for workload). Weighted occupancy target based on % of staffed beds that are regular/telemetry versus critical care. Patient Days exclude OB, Nursery, Rehab, Extended Care, Rehab, SCI. Patient days include immigration. Patient Days exclude observation care. Med/Surg is combination regular, telemetry, and critical care. Tripler staffed ICU beds (5) seemed to be an error, so weighted occupancy target is based on available beds rather than staffed
- (3) Tripler VA Psych days are a sum of the days that show up in VA and as Vets (K-61) in the DoD data

Facility Condition

Most of the major hospital buildings were built more than 20 years ago—and some were built more than 50 years ago. Architects and engineers on the project team completed cursory evaluations of the major clinical buildings on most of the sites. The architects' scores of the inpatient units and ambulatory clinics show a mix of functionality. Many of the inpatient units scored as either Green or Amber for size and configuration, (on a Red/Amber/Green scale—with Green being the best). However, quite a few spaces have Red scores, including size and configuration of the critical care units at Biloxi VAMC, size and configuration of the Medical/Surgical inpatient units at Eglin, NH Pensacola, and VA Gulfport, and configuration of several clinics at Keesler. The team also observed that most spaces are not ADA compliant.

In addition, the Engineers rated the major buildings at Tyndall, Biloxi VAMC, and Whiting Field as "Fair." The BMC Panama City building was observed to be in "Poor" condition. Definitions and more detailed output from these reviews are located in the Attachment to this Appendix.

Access

Nearly 95% of DoD enrolled and 71% of the VA enrolled beneficiaries are within 30 minute drives of any facility within their respective system. More than 99% of DoD and more than 93% of VA are within 60 minutes. In all Submarkets except Mobile, 90% or more of the DoD enrollees are within 30 minutes to any DoD facility. In the Mobile Submarket, only 50% of DoD enrollees are within 30 minutes, but 97% are within 60 minutes. The VA has a different profile: only in the Pensacola Submarket are 85% of the VA enrollees within 30 minutes of any VA facility. The percent drops to 78% in the Panama City Submarket, 75% in the Biloxi/Gulfport Submarket, and only .2% in the Eglin Submarket. (12% of VA enrollees live in the Eglin Submarket.). With the exception of the Eglin Submarket, at least 85% of enrolled Veterans are within 60 minutes drive of any VA facility.

Opening access so that DoD and VA beneficiaries can obtain primary care services at any VA or DoD facility dramatically improves the percent of visits that would meet the 30 minute drive time standard—especially for the VA. With *current* practices, only 67% of VA primary care visits were within 30 minutes of any VA facility. None of the 10,500 primary care visits of VA beneficiaries living in the Eglin Submarket were within 30 minutes of any VA facility, 65% of the visits from Biloxi/Gulfport, 74% from Panama City Submarket, and 83% from the Pensacola Submarket met the 30 minute standard. For DoD, 93% of primary care visits in the entire Market were within a 30 minute drive of any DoD facility. The percent within standard is 90% or greater in all Submarkets except Mobile, where only 46% of DoD primary care visits originated from ZIP codes where the beneficiaries were within 30 minutes drive of any DoD facility. By allowing DoD and VA beneficiaries to go to any VA or DoD facility for primary care, the percent of VA visits within 30 minutes of any facility increases to 95% or better in all Submarkets. For the DoD, opening access to Mobile would increase the number of visits within 30 minutes from 46% of total to 79% for the beneficiaries living in the Mobile Submarket.

None of the roughly 900 VA inpatient discharges that originated from VA beneficiaries outside of the Biloxi/Gulfport Submarket were within a 60 minute drive to any VA inpatient facility. For DoD, more than 90% of discharges were within 60 minutes of any DoD inpatient facility in all

submarkets except for Mobile (80% within 60 minutes) and Panama City (8% within 60 minutes). Further opening of access to the DoD facilities by the Veterans in the eastern Submarkets will improve these overall statistics.

Table 64: Baseline Combined Intra-System Inpatient Access

	Discharges Within 60 Minutes	Discharges Outside 60 Minutes	Total In-Market	% Within Standard	Total Outmigration	Total Discharges
Biloxi/Gulfport	6,241	204	6,445	96.8%	775	7,220
Eglin	4,395	495	4,890	89.9%	213	5,103
Mobile	358	386	744	48.1%	297	1,041
Panama City	4	126	130	3.1%	158	288
Pensacola	3,692	653	4,345	83.6%	398	4,743
Total Gulf Coast	14,690	1,864	16,554	88.7%	1,841	18,395

Costs

The total costs that were incurred by DoD and VA in FY02 to fund the care required by the Gulf Coast study market beneficiaries represent the current baseline total annual system costs for the Gulf Coast market. This is the annual cost required to fund the care provided to the Combined Beneficiary population in the Gulf Coast study market and includes all direct care provided directly by DoD and VA facilities as well as indirect care purchased by DoD and VA for these beneficiaries. The baseline cost performance for the Gulf Coast study market is illustrated in the table below.

Table 65: Costs in the Gulf Coast

Baseline Total Annual Cost to Deliver Care to DoD and VA Beneficiaries in Reside in the Gulf Coast Market (FY2002)			
<i>Cost Figures in Thousands ('000s)</i>	GULF COAST COSTS BY AGENCY

(1) Market enrollees and market users for FY2002 extracted from the Joint Assessment Study Series 4 Database

The Gulf Coast study market current baseline annual cost summarized above provides a high level perspective of the total costs for delivering inpatient care and outpatient care, in the aggregate for the entire study market. These inpatient and outpatient costs can also be broken down by Product Line as illustrated in the tables that follow

Table 66: Costs by Product Line

Baseline Total Annual Cost to Deliver Inpatient Care to DoD and VA Beneficiaries in Reside in the Gulf Coast Market (FY2002)

Total	205,912	104,729	310,641	8,824	6,063	14,887	141,064	1,650	142,614	355,800	112,343	468,143

The cost data available for the Gulf Coast market can be used to calculate the current baseline cost performance for specific sub-segments of each study market, such as select geographic submarkets, for select beneficiary populations, and for select Product or Clinical Service Lines. A clinical service line level incremental cost impact analyses at the submarket level will be illustrated in the analysis of the opportunity to rationalize inpatient care in Gulf Coast that follows.

3.4 Findings from the Application of the Study Methodology to Examine the Opportunity to Consolidate Inpatient Care in Biloxi/Gulfport

This subsection provides the results of an analysis that examines the opportunity to consolidate inpatient care in Biloxi/Gulfport Submarket (Medical/Surgical care, including Critical Care). Two scenarios are provided to demonstrate the capacity impact and economic implications of centralizing the care at Keesler Medical Center (Scenario A) and VAMC Biloxi (Scenario B). There are also assumptions imbedded in this analysis that open/expand VA access to Eglin and NH Pensacola in the eastern Submarkets.

Of the combined 49 health care facilities included in this Study (across the three Market Areas), Keesler and VAMC Biloxi are by far the closest in proximity to each other (separated by a few hundred yards) with respect to health care facilities that offer a similar mix of inpatient services. In an era when DoD/VA sharing has grown to become a key initiative for the Federal government, Mitretek is certainly not the first to inquire about the possibility of consolidation given the close proximity of these two hospitals. In July, for example, members of the VA CARES Commission paid a visit to the VA Biloxi and Gulfport Divisions as well as Keesler Medical Center and met with VA and DoD leadership, including the commanding Brigadier General. The site visit notes raise several points associated with the opportunity for increased collaboration between VAMC Biloxi and Keesler, with one option being a future delivery model whereby Keesler would “take care of inpatient services while VA would take care of outpatient

services.”⁴¹ One month later, in a CARES Commission Post Hearing Summary for VISN 16, the Commissioners recommended that an “additional study needs to be undertaken to assess the cost/benefit of the options available at VA Biloxi including partnership with Keesler.”⁴² The application of this Study’s methodology takes the next step in exploring this opportunity based on the current performance of these two Federal assets.

Baseline Situation

Demand for Inpatient Services

Demand for this analysis focuses on the Medical/Surgical and Critical Care inpatient utilization by beneficiaries who reside in the Gulf Coast Market Area. The table below shows the total discharges and average lengths of stay for in-market consumption, out-migration (other Federal providers) and indirect care (private network providers). The FY02 volume in this exhibit excludes Mental Health, Rehabilitation, Extended Care, and Obstetrics/Newborns. A full profile of inpatient and outpatient care demand in the Gulf Coast can be found in the Market Assessment Appendix.

Table 67: Total Utilization of Inpatient Medical/Surgical Care by Gulf Coast Beneficiaries

Submarket	In-Market (a)			Out-Migration (b)			Non-Direct Care (c)			Total
	DoD	VA	Total	DoD	VA	Total	DoD	VA	Total	
Biloxi/Gulfport	2,869	1,289	4,158	72	261	333	2,209	18	2,227	6,718
Eglin	2,722	65	2,787	97	59	156	3,642	14	3,656	6,599
Mobile	249	245	494	23	105	128	1,816	55	1,871	2,493
Panama City	42	41	83	22	66	88	2,784	34	2,818	2,989
Pensacola	2,379	138	2,517	122	108	230	3,886	81	3,967	6,714
Total Discharges	8,261	1,778	10,039	336	599	935	14,337	202	14,539	25,513
<i>ALOS</i>	<i>4.53</i>	<i>7.12</i>	<i>4.99</i>	<i>4.15</i>	<i>7.12</i>	<i>6.05</i>	<i>6.82</i>	<i>4.11</i>	<i>6.78</i>	<i>6.03</i>

(a) Utilization by resides of each submarket at federal facilities in the Gulf Coast.
 (b) Beneficiaries living in the Gulf Coast receiving care by a federal provider outside the Market.
 (c) Services provided by non-federal providers through fee-basis care (VA) and purchased care (DoD).

The in-market volume above reflects care provided by the four facilities offering Medical/Surgical care in the Gulf Coast (excludes Gulfport) to beneficiaries who reside in this Market. Of the 14,337 indirect care discharges (DoD Indirect), over half represent patients 65 years of age or older (mostly TRICARE For Life enrollees). If patients over 65 are excluded from DoD indirect care, (including direct care), 57% of the remaining inpatient demand is accommodated by DoD and VA hospitals in the Gulf Coast.

With respect to the Biloxi/Gulfport Submarket, roughly 71% (or 2,048) of the 2,869 DoD in-market discharges were generated by retirees and their family members. Not surprisingly, nearly all of this care was provided at Keesler (11 total discharges at Eglin and Naval Hospital Pensacola combined). Similarly, nearly all of the 1,289 VA in-market direct discharges took place at VAMC Biloxi. In terms of VA out-migration, 185 of the 261 discharges occurred at the

⁴¹ CARES Commission Site Visit Report, page 2; Visit: July 2, 2003; Prepared by K. Collier, July 14, 2003

⁴² CARES Commission Post Hearing Summary, Section V., page 4; August 26, 2003

VA Medical Center in New Orleans, which is the VA's tertiary care hospital serving the Gulf Coast Market and Southeast Louisiana.

Supply

Inpatient facilities in the Gulf Coast Market include two in the eastern end of the Market and three hospitals in the Biloxi/Gulfport Submarket in the west. These facilities are:

- Eglin
- NH Pensacola
- VAMC Biloxi
- VA Gulfport
- Keesler

Eglin and NHP are located approximately 50 miles apart in the eastern Submarkets of Eglin and Pensacola. Each facility primarily caters to the needs of the active duty and their family members in their separate and distinct services areas, centered by Eglin Air Force Base and Naval Air Base Pensacola respectively. The facilities are similar in terms of their size, service mix, and volume. Eglin is a 65-bed hospital (available beds) which had an average daily census of 28 in FY02. Roughly 44% of its total workload (5,000 discharges) was Obstetrics/Newborn. In terms of Medical/Surgical care, Eglin has available capacity for 20 additional patients (7,285 bed days), with an occupancy target of 85% for Medical/Surgical and 65% for Critical Care.

Naval Hospital Pensacola, located west of Eglin, is a 60-bed facility with an average daily census of 25 with 37% of its total discharges (3,600) attributed to Obstetrics/Newborn. The hospital currently has a sharing agreement with the VA for inpatient care, and with demand by the veterans/retirees on a steady increase, there are plans to reevaluate the agreement to allow for more VA access. In FY02, VA enrollees accounted for 87 discharges (according to a patient classification field in DoD data). Its current workload levels suggest that NHP has available capacity for 28 additional patients (10,193 bed days) for Medical/Surgical care (with a 85/65 occupancy target).

The Gulf Coast Veterans Health Care System is a five-division health care system with hospitals in Gulfport and Biloxi, Mississippi (the system also operates three outpatient clinics). The Gulfport Division provides inpatient and outpatient Mental Health services and houses an Alzheimer's dementia unit. Through a collaborative agreement with Keesler AFB, BMC Gulfport also accommodates the needs of military personnel with acute mental health care needs. This facility was excluded from the Medical/Surgical Scenarios later in this section (it currently has one Medical/Surgical bed), but it plays a vital role in providing behavioral health services to the entire Gulf Coast Market. Its future delivery model and location (currently under review by the VA) will have a direct impact on the other two facilities in Biloxi/Gulfport.

The facilities included in this analysis, VAMC Biloxi and Keesler Medical Center, are located in Biloxi, 8 miles north of the BMC Gulfport facility. The VA Biloxi campus has 37 buildings on approximately 125 acres of land. It is surrounded on the east and west by Keesler AFB housing. VAMC Biloxi serves as the only VA general medical facility for the Gulf Coast Market, with 40 Medical/Surgical beds and 9 Intensive Care beds. Neighboring Keesler (81st Medical Group) is a 90-bed tertiary care center, originally constructed as a 300-bed facility, which currently has a reported 63 Medical/Surgical beds and 22 Intensive Care Units (available beds). The unused

suites (around 200 beds) are currently being used for outpatient services and administrative functions. The workload, capacity and operating costs for these two facilities are provided in the balance of this section.

Capacity

For purposes of the analysis provided in this section, Medical/Surgical and Critical Care capacity was only measured for VAMC Biloxi and Keesler. An 85% occupancy for Medical/Surgical care and 65% occupancy for Critical Care was used to measure the Net Maximum Capacity based on available beds. Capacity is measured in a status quo environment with the analytical assumption that each facility is operating with adequate resources to meet the Medical/Surgical care needs of their respective populations. The table below represents the baseline workload and estimated available capacity for Medical/Surgical and Critical Care inpatient services at Keesler and VAMC Biloxi.

Table 68: Estimated Medical/Surgical Capacity at Keesler and VAMC Biloxi

	Keesler Medical Center			Biloxi VAMC		
	Med/Surg	Critical Care	Total	Med/Surg	Critical Care	Total
Baseline Capacity						
Available Beds Reported	63	22	85	40	9	49
Max Net Capacity (85/65) (a)	19,546	5,220	24,765	12,410	2,135	14,545
Baseline Bed Days (FY02)	10,596	3,761	14,357	12,695	912	13,607
Max Net Occupancy (%)	54%	72%	58%	102%	43%	85%
<hr/>						
Avg Daily Census	29	10	39	35	2	37
Baseline Discharges	3,021	696	3,717	1,757	161	1,918
Avg Length of Stay	3.5	5.4	3.9	7.2	5.7	7.1
<hr/>						
Net Capacity Available (b)						
Estimated Bed Days	8,950	1,459	10,408	(285)	1,223	938
Estimated Discharges	2,552	270	2,822	(39)	216	177
Equivalent Beds	25	4	29	(1)	3	2

(a) Estimated capacity of the available beds (in days) based on 85% target occupancy for med/surg and 65% for critical care.
 (b) Discharges and equivalent beds based on current ALOS.

Based on the number of available beds (85) at Keesler, this would suggest there are 25 Medical/Surgical beds and 4 Critical Care beds available for incremental volume. To the contrary, VAMC Biloxi baseline Medical/Surgical days and available beds suggest the facility has essentially no available capacity with an estimated 3 critical care beds available (based on the 85% Medical/Surgical and 65% Critical Care occupancy targets). The capacity estimates clarify the simple point that if there was a significant influx of Medical/Surgical volume in Biloxi/Gulfport (or neighboring Submarkets), Keesler would be in a better position to handle the incremental volume in a status quo mode. This reinforces conclusions drawn during the VA CARES process.

As illustrated in the table below, the vast majority of the capacity (shown in bed days) is utilized by patients originating from within the Gulf Coast Market with a moderate amount of in-migration from outside the five Submarkets.

Table 69: Patient Origin at Keesler & VAMC Biloxi

Patient Origin	Keesler	Biloxi
Biloxi/Gulfport	10,618	8,957
Mobile	438	1,968
Pensacola	716	948
Eglin	1,063	445
Panama City	212	216
In-Migration	1,310	1,073
Total M/S & ICU Days	14,357	13,607

The total number of bed days from the eastern Submarkets to VAMC Biloxi is 1,609 – or 12% of its total. Despite the 3½ to 4½ hours of drive time from these three points, this figure still appears to be relatively low considering the fact that VAMC Biloxi is the only acute care facility in the Market. From a VA planning standpoint, the true demand from the nearly 135,000 eligible veterans residing in the Florida Panhandle is suppressed to some extent because all the veterans who seek inpatient services are not necessarily emerging in the VA data. At least one-third of this eligible population is over 65 years of age, which means one can assume that a sizeable portion of these veterans are relying on Medicare, although some most likely supplement this with benefits through the DoD TRICARE program (many through the TRICARE for Life plan). An additional 24,000 are retirees (dual eligible) under 65 who may also enroll with TRICARE. According to TRICARE claims data (FY02), private hospitals located in the Pensacola area received over 2,000 Medical/Surgical discharges of Combined Beneficiaries 65 years and older who reside in this three-county Submarket. An additional 1,500 discharges came from patients originating from the Eglin Submarket. In general, there exists a growing demand in the Florida Panhandle from a growing group of aging veterans who choose not to or cannot travel to Biloxi for care, but would utilize VA inpatient services if a hospital were located in one of the eastern Submarkets. For planning purposes, this makes it difficult to estimate the true level of VA inpatient demand in this Market.

Cost

FY02 operating costs were compiled from several sources for Keesler and VAMC Biloxi to gauge the estimated delivery costs associated with inpatient services, particularly Medical/Surgical care. The purpose of introducing operating costs into this analysis is not to compare operating cost efficiency between the two facilities and/or delivery systems, but to appreciate in an aggregate sense the different resources required by the two systems to offer similar inpatient services to their respective patient populations.

The total combined operating cost of Keesler and VAMC Biloxi is \$300.8M (DoD, \$167.8M; VA \$133M). This includes all health care services provided at the facility as well as other system-specific missions (e.g., Readiness Programs at Keesler). With a focus on inpatient services, the exhibit below provides FY02 operating costs for Keesler and VAMC Biloxi for Medical/Surgical and Critical Care.

Table 70: Total Operating Costs for Inpatient Medical/Surgical Care in Biloxi

FY 2002	Keesler Medical Center (a)			Biloxi VAMC (b)		
	Med/Surg	Critical Care	Total	Med/Surg	Critical Care	Total
Operating Costs (in '000s)						
Variable Cost	17,389	8,382	25,771	15,139	1,343	16,482
Fixed Cost	4,977	2,144	7,121	4,333	344	4,676
Total Cost	\$22,366	\$10,526	\$32,891	\$19,471	\$1,687	\$21,158
Average Cost per (actual \$)						
Discharge	\$7,403	\$15,123	\$8,849	\$11,082	\$10,477	\$11,031
Bed Day	\$2,111	\$2,799	\$2,291	\$1,534	\$1,850	\$1,555

(a) Costs were captured from MEPRS and SADR data. Fixed and variable were estimated at a SEEC code level.
(b) Cost data was obtained from DSS National Data Extracts. Variable costs were drawn from Account Level Budget Cost Center Detailed Reports.

The amounts shown above are a “preview” of the operating costs associated with this select inpatient volume for each facility. On a per discharge basis, it is not surprising that VA is \$1,000 higher than DoD given the difference in case mix. To that end, the average cost per day is less for VAMC Biloxi due to the average length of stay, which is double that of Keesler’s. With the average operating cost per bed day of \$1,900 (of the two facilities), future operating cost savings realized through increased collaboration or consolidation can be seen as an investment toward the future health care needs of the Combined Beneficiaries.

Impact of Realigning Inpatient Services

Analytical Approach

Mitretek assessed the opportunity to consolidate Medical/Surgical care in Biloxi/Gulfport by showing the impact of centralizing this care at Keesler (Scenario A) and VAMC Biloxi (Scenario B). These scenarios were built on the baseline performance of each facility, their current capacity, and the following key assumptions:

1. *Eastern Submarket Facilities Recapture Medical/Surgical Care.* This assumes DoD and VA beneficiaries currently residing in the two eastern Submarkets of Eglin and Pensacola would have access (eligibility) to receive care at the nearest Federal hospital with available capacity, namely Naval Hospital Pensacola or Eglin (and on the private network if necessary). In the two scenarios, the bed days of care for these beneficiaries were identified and deducted from the baseline for the measurement of capacity at VAMC Biloxi and Keesler. Additionally, bed days of beneficiaries of the Mobile submarket who have nearly equal access (drive time), to the Biloxi hospitals and Naval Hospital Pensacola were deducted from the baseline at 50% of the total to adjust for the likelihood of utilizing Biloxi hospitals.

2. *Practice Patterns Held Constant.* In the scenarios, the Medical/Surgical volume is transferred between these facilities without adjustments made to account for the different ways in which DoD and VA may deliver clinical services. This is accomplished by simply transferring all the bed days from one facility to the other without altering the average length of stay (ALOS).
3. *Operating Cost Savings of 10%.* An in-depth cost accounting analysis would be required to measure the potential operating cost savings to be realized by consolidating Medical/Surgical services between the two facilities. This analysis assumes that operating costs less 10% are transferred with the volume. This is a conservative placeholder given that fixed indirect costs can be as high as 20% on an average per discharge/bed day basis.
4. *Capital Requirements Excluded.* It is unrealistic to develop a complete estimation of capital costs and incremental recurring expenditures associated with the consolidation options presented because of the many uncertainties that are linked to each end of the transfer. Renovation and new construction costs on a per bed basis are offered as a reference point. While capital costs play a pivotal role in any decision-making process relating to the integration of clinical services, this assessment instead focuses its attention on gauging the *feasibility* of consolidation with consideration given access, capacity levels, and service mix.

As reflected in the Study's methodology, we approached this opportunity from the perspective of the Combined Beneficiaries who currently rely on these systems, as well as the U.S. taxpayers who financially support the Departments. As exercised in the Puget Sound example, this approach focuses initially on the desirability of a particular option, specifically on the potential for the realignment of health care delivery to improve patient access to care and/or to reduce the costs of delivering the care. The VAMC Biloxi-Keesler example places less emphasis on access in this portion of the Market, given the location and capabilities of these two facilities, and allocates more attention to the possible economic benefits which could result from a future delivery model where the resources could be leveraged to offer the same (if not higher) level of quality care at a reduced cost. From a Federal dollar perspective, the logic would suggest that any cost savings in operations or capital expenditures would be shifted elsewhere in the systems to enhance the delivery of health care services to the benefit of the patients.

Scenario A (Keesler as receiving facility) and Scenario B (VAMC Biloxi receiving) are summarized in two tables below. The below estimate the incremental capacity needed in order to absorb the transfer of Medical/Surgical volume (in each direction) is based on a status quo environment (with the exception of the specific eastern Submarket patient migration assumptions noted earlier).

Table 71: Scenario A - Consolidating Inpatient Care in Biloxi/Gulfport Submarket

SCENARIO A	Biloxi VAMC - Status Quo			Keesler - Status Quo			Post-Transfer at Keesler		
	M/S	ICU	Total	M/S	ICU	Total	M/S	ICU	Total
Capacity (Bed Days)									
Baseline Demand (a)	12,695	912	13,607	10,596	3,761	14,357	23,291	4,673	27,964
Less: Pt. Migration from East (b)	(2,434)	(159)	(2,593)	(1,555)	(655)	(2,210)	(3,989)	(814)	(4,803)
Status Quo Demand	10,261	753	11,014	9,041	3,106	12,147	19,302	3,859	23,161
Maximum Net Capacity (c)	12,410	2,135	14,545	19,546	5,220	24,765	19,546	5,220	24,765
Capacity Surplus/Deficit	2,149	1,382	3,531	10,505	2,114	12,618	244	1,361	1,604
Equivalent Additional Beds Required	→						-	-	-
Status Quo Operating Costs									
Operating Cost per Day	\$1,534	\$1,850	\$1,555	\$2,111	\$2,799	\$2,291	\$1,723	\$2,577	\$1,865
Baseline Operating Cost (\$million)	\$19.4M	\$1.7M	\$21.1M	\$22.4M	\$10.5M	\$32.9M	\$33.2M	\$9.9M	\$43.1M
Operating Cost less Migration	\$15.7M	\$1.4M	\$17.1M	\$19.0M	\$8.7M	\$27.7M			

(a) FY 2002 total medical/surgical and critical care bed days of care.
 (b) Bed days of patients who reside in Eglin, Pensacola and Panama City and 50% of total bed days from Mobile Submarket patients.
 (c) Total capacity calculated based on available beds at 85% medical/surgical occupancy and 65% critical care occupancy.

The results shown in Scenario A indicate that Keesler, from a capacity standpoint, could assume the Medical/Surgical volume currently provided at VAMC Biloxi without the need for renovation or new construction based on these static figures. Clearly, this does not suggest that other operational and facility-related requirements would not surface if such a transfer occurred. If additional beds were required (now or in the future), a total upgrade of existing space per bed would be roughly \$121,000 (assuming 600 BGSF/bed and including project costs) in the Biloxi area.⁴³ New construction per bed (at 700 BGSF/bed) would be an estimated \$189,000.⁴⁴

A transfer could result in recurring cost savings on several fronts. The figures above show \$1.7M of annual savings in operations. As noted earlier, this uses a conservative discount of 10% from the total operating costs per unit – in this case, VA Biloxi’s total delivery costs. Other recurring costs, such as facility maintenance and repair (M&R), are difficult to estimate but it currently costs an estimated \$2.6 million per year to maintain the VAMC Biloxi inpatient facility.⁴⁵ The use of the freed space at VAMC Biloxi post-transfer would determine the actual portion of the amount of savings or cost avoidance. For example, the M&R costs would go unchanged if VA Biloxi backfilled the space with extended care services, but it would be considered a “savings” in terms of annual M&R attributed to the future delivery of Medical/Surgical inpatient care. This example would also apply to the \$1.3 million in deferred maintenance currently estimated for VAMC Biloxi.⁴⁶

Scenario B centralizes all Medical/Surgical care at VAMC Biloxi with the need for at least 24 additional beds to accommodate the incremental volume from Keesler. As noted in Scenario A, the capital requirements would start at \$4.5 million for new construction of 24 beds.⁴⁷ More importantly, this Scenario illustrates that regardless of the number of beds needed, new construction would be required at VAMC Biloxi. This presents a host of additional challenges in terms of facility planning and mix between the need for renovation and expansion.

⁴³ Marshall & Swift Level III renovation estimate (complete restructuring/total upgrade) adjusted for Biloxi area of \$144.48/BGSF and assuming 600 BGSF/bed with 40% project costs.

⁴⁴ Marshall & Swift; \$192.62/BGSF (adjusted for Biloxi area).

⁴⁵ Estimated at 3% of the \$86.5 million Plant Replacement Value (PRV); VA CARES Valuation Study, 2002.

⁴⁶ VA CARES Valuation Study, 2002.

⁴⁷ Marshall & Swift new construction estimate adjusted for Biloxi area of \$192.64/BGSF and assuming 700 BGSF/bed with 40% project costs.

Table 72: Scenario B - Consolidating Inpatient Care in Biloxi/Gulfport

SCENARIO B.	Biloxi VAMC - Status Quo			Keesler - Status Quo			Post-Transfer at Biloxi VAMC		
	M/S	ICU	Total	M/S	ICU	Total	M/S	ICU	Total
Capacity (Bed Days)									
Baseline Demand (a)	12,695	912	13,607	10,596	3,761	14,357	23,291	4,673	27,964
Less: Pt. Migration from East (b)	(2,434)	(159)	(2,593)	(1,555)	(655)	(2,210)	(3,989)	(814)	(4,803)
Status Quo Demand	10,261	753	11,014	9,041	3,106	12,147	19,302	3,859	23,161
Maximum Net Capacity (c)	12,410	2,135	14,545	19,546	5,220	24,765	12,410	2,135	14,545
Capacity Surplus/Deficit	2,149	1,382	3,531	10,505	2,114	12,618	(6,892)	(1,724)	(8,616)
Equivalent Additional Beds Required	→						19	5	24
Status Quo Operating Costs									
Operating Cost per Day	\$1,534	\$1,850	\$1,555	\$2,111	\$2,799	\$2,291	\$1,705	\$2,577	\$1,850
Baseline Operating Cost (\$million)	\$19.4M	\$1.7M	\$21.1M	\$22.4M	\$10.5M	\$32.9M	\$32.9M	\$9.9M	\$42.8M
Operating Cost less Migration	\$15.7M	\$1.4M	\$17.1M	\$19.0M	\$8.7M	\$27.7M			

(a) FY 2002 total medical/surgical and critical care bed days of care.
 (b) Bed days of patients who reside in Eglin, Pensacola and Panama City and 50% of total bed days from Mobile Submarket patients.
 (c) Total capacity calculated based on available beds at 85% medical/surgical occupancy and 65% critical care occupancy.

For this scenario, there is also opportunity for recurring cost savings from this transfer. The figures above place the operating cost savings at \$2 million. As with Scenario A, other recurring costs, such as facility maintenance and repair (M&R) could also be avoided, depending on use of freed space at Keesler after the transfer. Currently, M&R is an estimated \$4.8M per year to maintain the Keesler Medical Center.⁴⁸

3.5 Findings from the Assessment Applying the Collaboration Framework

The VA and DoD have 13 sharing agreements in effect involving the VA Gulf Coast Veterans Health Care System and six military facilities. At the time of the first site visit, the dollar value of these exchanges was approximately \$2M, affecting inpatient, outpatient, and administrative services. Examples of these include agreements between VAGC, VHS, and Keesler for Behavioral Health services, and with Naval Hospital Pensacola and Eglin for medical surgical care. VA and DoD officials have devoted a great deal of attention to two significant projects: the planning of a 140,000 square foot ambulatory care center adjacent to NH Pensacola, and a CBOC adjacent to Eglin AFB Hospital.

During the second site visit, both the quantitative methods used in the rationalization of inpatient care example and the Collaboration Framework were reviewed. As well, Mitretek presented and facilitated discussion about more than 50 opportunities for increased DoD/VA collaboration in the Market. These opportunities included ideas that were applicable to all markets (grouped into the Collaboration Framework) as well as ideas specific to the Gulf Coast Market and/ or specific to certain facilities in the Market. The Attachment provides detail about these opportunities.

Along a continuum of Separate, Coordinated, Connected, Integrated, and Consolidated, most of the relationships among the hospitals in the Market are either Separate or Coordinated. In terms of clinical workload, VAMC and Keesler are classified as Connected since there are a high number of referrals between the two (e.g. DoD psych is at VA Gulfport). They are also Connected in Logistics, since there is some mutual examination of best pricing and service. The relationship in staffing is Coordinated since there is some cross support in peaks and valleys. Management and Education are also Coordinated since there is some joint planning and selective

⁴⁸ Estimated at 3% of the \$160 million Plant Replacement Value (using \$200/sf @ 800,000 sf). Estimate supported by VFA review.

exchange of teaching methods. However, Facilities, Business Processes, IM/IT, and Research are all scored as Separate.

VAMC and Eglin’s and VAMC and NH Pensacola’s relationship have the same profile to each other: Connected for Clinical Workload, Coordinated for Management and Logistics, but Separate for Facilities, Staffing, Business Processes, Education/Training, and Research.

The feedback sessions during the second site visit affirmed the use of the collaboration framework as a useful way to look at the relationship between VA and DoD within the Market. The framework highlights the many dimensions of collaboration, and can be used as a frame of reference in future planning.

Table 73: VAMC & Keesler Relationship Grid

Domain	Separate	Coordinated	Connected	Integrated	Consolidated
Clinical Workload	Insignificant referrals	Regular communications	High numbers of referrals	Significant number of referrals as one	Protocol-driven placement of all patients
Facilities	Distant	Some sharing where duplication exists	Projects & facilities come from master planning	Many departments share space	One facility or set of facilities
Staffing	Distinct	Support in peaks and valleys	Joint staff planning	Multiple examples of single/joint staffing	Single staffing
Business Processes	Different	Reduce barriers	Work flows understood & acted on	Transparent	Single system
Management/Governance	No Relation	Joint planning sessions	Overlap of key functions	Overlap of key functions	One governance & management structure
IM/IT	Separate systems	Evidence of exchange of info	Moving toward systems interface	Complete interoperability	One system
Logistics	Little if any exchange	Borrowing, bartering and contractual exchange	Mutual examination of best pricing and service	Selective joint contracting of major areas of procurement	One supply chain
Education & Training	Distinct	Selective exchange of methods	Frequent use of joint programs and curriculum	Most programs and curriculum are same/similar	Unified program
Research	Distinct	Selective exchange of protocols	Joint planning and review of many studies	Significant overlap of protocols and review	Unified program

Table 74: VAMC & NH Pensacola Relationship Grid

Domain	Separate	Coordinated	Connected	Integrated	Consolidated
Clinical Workload	Insignificant referrals	Regular communications	High numbers of referrals	Significant number of referrals as one	Patient-driven placement of all patients
Facilities	Distant	Some sharing where duplication exists	Projects & facilities come from master planning	Many departments share space	One facility or set of facilities
Staffing	Distinct	Support in peaks and valleys	Joint staff planning	Multiple examples of single/joint staffing	Single staffing

3.6 Recommendations for the Gulf Coast Market

The two Scenarios presented in this analysis illustrate the opportunity for consolidation anchored by the fundamental measurement of capacity. The analysis finds that the *current* performance of Keesler and VAMC Biloxi indicates that these facilities are independently well positioned to meet the demand of their respective populations without an excessive surplus of capacity. However, if immediate consolidation was required, these two Federal providers could merge medical/surgical care in a status quo environment (i.e., current operations) without jeopardizing the existing mix of services, access to care and/or the recurring costs of delivery. This analysis justifies the need to explore a future delivery model of centralized acute care services in Biloxi, MS. The following two specific (and one general) recommendations are offered:

Mitretek recommends that DoD and VA establish a joint task force in the near term to move forward with an in-depth operational and facility assessment that includes a future consolidated model of Medical/Surgical care in Biloxi based on the present and projected demand of the beneficiaries.

This effort should set aside the uncertainty of policy-oriented issues such as BRAC and/or integration of GME programs. The detailed analysis should exhaust all avenues in terms of care delivery models with patient demand/health care needs as the central driver. Facility-specific considerations should be secondary in this planning process.

Mitretek recommends the VHA refrain from drawing any conclusions (and retract any offered) until a detailed reexamination of the Keesler alternative with DoD representatives is conducted.

VHA recently released the Realignment Study for VISN 16, which through a cost/benefit analysis of several alternatives concludes that all services currently offered at the BMC Gulfport be moved to VAMC Biloxi. This “preferred alternative” would allow for the “prediction of the outcomes for veteran patient services in a single consolidated location, to produce a single standard of care.”⁴⁹ A separate alternative included a “sharing agreement for provision of clinical services with Keesler” which was “retained as local command support for sharing may change again during the CARES process.”⁵⁰ The current direction of this VHA study signals a lack of collaborative planning on the part of both Departments.

Mitretek recommends the VHA refrain from drawing any conclusions (and retract any offered) until a detailed reexamination of the Keesler alternative with DoD representatives is conducted. The current preferred alternative includes renovation of 123,000 DGSF and new construction of 155,000 DGSF with total capital costs of approximately \$30M.⁵¹ In concert with the methodology presented, Mitretek feels it is premature to draw conclusions without assessing a consolidated delivery model for duplicated services between DoD and VA given the remarkable proximity of these three facilities.

Mitretek recommends that the organizations continue to consider, plan for, and act on most of the identified opportunities in the Market.

⁴⁹ Narrative component of VHA Realignment Study, VISN 16, November 21, 2003; p. 18.

⁵⁰ Realignment Study, p. 18

⁵¹ Realignment Study, pgs. 4 and 8.

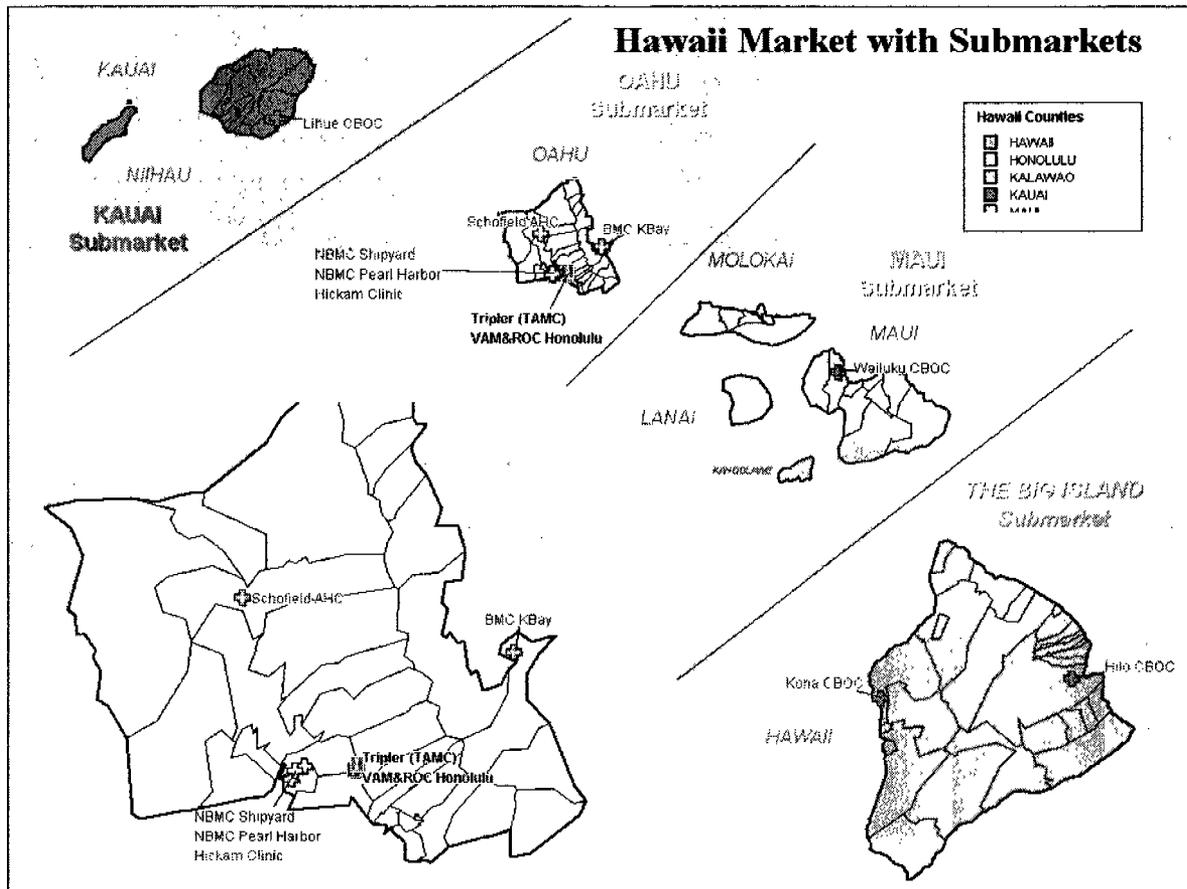

These opportunities identify the present avenues for improving care delivery to military and veteran beneficiaries residing in the Market. All such actions should proceed from a deliberate joint planning process.

**HAWAII
MARKET
ASSESSMENT**

4 MARKET ASSESSMENT- HAWAII MARKET

A goal of this study is to view the market area from the perspective of the Combined Beneficiary⁵², rather than from the perspective of the System delivering the care. Thus, the market has been divided into four submarkets—based on geography rather than existing care delivery models: Kauai, Maui, Oahu, and The Big Island. These are displayed in the map below.

The Hawaii Market area for this Study consists of 15 DoD and VA facilities—1 hospital and 10 outpatient centers (plus four active-duty-only facilities). The facilities include:

Table 76: Study Market Area Definition for Hawaii

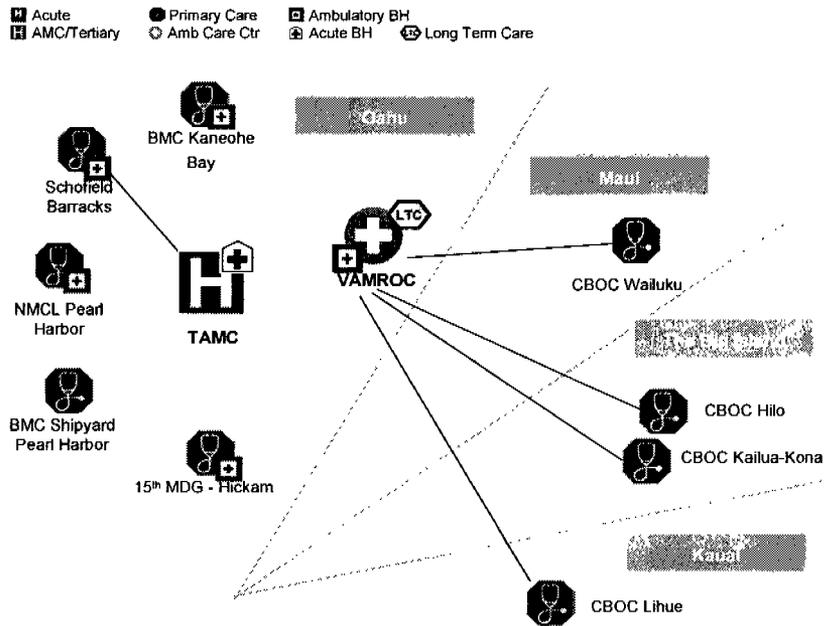

Submarket	County	DoD Facilities	VA Facilities
Oahu	Honolulu	<ul style="list-style-type: none"> – Tripler AMC – 15th Med Group Hickam – BMC Kaneohe Bay – BMC Makalapa – BMC Pearl Harbor Naval Shipyard – Schofield Barracks 	<ul style="list-style-type: none"> – VA Medical & Regional Office Center – Honolulu (VAMROC)

⁵² See the Introduction of this Appendix for a definition of Combined Beneficiary.

Submarket	County	DoD Facilities	VA Facilities
Maui	Maui		– Wailuku CBOC
Kauai	Kauai		– Lihue CBOC
The Big Island	Hawaii		– Hilo CBOC – Kailua-Kona CBOC

The Submarkets and their facility relationships are illustrated below.

Table 77: Hawaii Submarkets and Facilities

4.1 Populations

4.1.1 Eligible Population

The Hawaii Market Area has approximately 248,500 eligible Combined Beneficiaries—approximately 15,000 of which are “dual eligible” for both DoD and VA benefits. The eligible population is split almost evenly between DoD and VA—with 55% of the eligible population DoD. The Oahu submarket has 85% of the eligible population (as well as the majority of the treatment facilities)

In the Hawaii Market overall, 31% of the DoD 142,000 eligible population are Active Duty, 42% are Active duty family members, 10% are Retiree, 16% are Retiree Family Members. This is a different profile than the Puget Sound and Gulf Coast Markets, where 20% of the eligibles are Active Duty, 26-28% are Active Duty Family Members , about 20% of Retirees and about 30% are Retiree Family Members. Of the 116,000 eligible Veterans, 64% are Priority Group 8 and 18% are Priority Group 5. The rest are spread with about 3-5% each in the other Priority Groups.

4.1.2 Enrolled Population

The enrolled population of Veterans in the Hawaii Market (29,600) equaled 25% of the eligible population. The number of enrolled DoD exceeded the number of eligible DoD on average. However, it is mostly driven by Oahu—where the number of enrolled is 145% of the number of eligible. In the other Submarkets, the number of enrolled is equal to less than 20% of the number of eligible. (Note that for DoD there are actually more enrolled than eligible—because DoD beneficiaries can be enrolled in a facility outside the Market area).

Below are tables that display the enrolled population broken down by Priority Group and Beneficiary Category.

Table 78: VA Enrolled Population by Priority Group

1	2	3	4	5	6	7	8
3,794	2,957	5,298	337	7,890	283	617	8,448
12.8%	10.0%	17.9%	1.1%	26.6%	1.0%	2.1%	28.5%

Table 79: DoD Enrolled Population Beneficiary Category

Active Duty	Active Duty Family Members	Retiree	Retiree Family Members
62,007	117,769	8,311	15,625
30.4%	57.8%	4.1%	7.7%

4.1.3 Users

The number of Combined DoD/VA unique users of either the direct or indirect care system (net of dual users) equaled 88% of the combined enrolled population. The number of unique DoD users of either the direct or indirect care system (196,000) was equal to 96% of the DoD enrolled population, and the 16,000 unique VA users of either direct or indirect care equaled 55% of the

VA enrolled population. Indirect care is Purchased Care for the DoD and Fee Basis Care for the VA. The relationship of VA user to VA enrollees is much lower in Hawaii than in the other Markets (where it is 69-77%).

In the DoD, 31% of the total users accessed indirect care. In the VA only 18% used indirect care. For *direct* care, 4% of users were dual users (used both systems).

4.2 Workload

4.2.1 Inpatient: Direct Care

Residents of the Hawaii Market area consumed about 13,700 discharges and about 60,600 inpatient days of direct care in Medicine (including Rehab), Surgery, Behavioral Health (including Substance Abuse), and Ob/Newborn (Post Partum and Nursery days both counted). These volumes include out-migration, but exclude purchased care and extended care.

Direct care discharges for this type of care varied by Beneficiary Group. If Veterans are excluded from the DoD volume, 62% of discharges were consumed by Active Duty Family Members, 22% were generated by Active Duty, and 7% each for Retirees and Retiree Family Members. The data do not allow us to break down the Veterans admitted to Tripler by Priority Group.

Because most of the discharges and inpatient days are at Tripler, it is necessary to use the Patient Classification System to identify the Veterans (K-61) who generate workload at Tripler. These Veterans are not necessarily patients of or referred by the VA system. Using this methodology, it appears that 16% of the discharges and 34% of the direct care inpatient days generated by the residents of this market were Veterans. 84% of the discharges and 66% of patient days were DoD. 85% of direct care Behavioral Health days were generated by Veterans while 62% of total direct care Medicine days and 75% of the direct care Surgery days were generated by the DoD. Note that of the 9,500 Medicine days for DoD, 2,400 are Pediatrics.

As seen in the case mix table below, of direct care inpatient days generated by Combined Beneficiaries from this market, 25% were for Medicine (including rehab), 21% for Behavioral Health, 25% for Surgery and 28% for Ob/Newborn (post partum and nursery both counted). The case mix is different for the two Services. For the VA, 53% of its direct care days were for Behavioral Health and only 18% of its direct care days were for Surgery. This compares to 5% and 28% respectively for the DoD.

Table 80: Percent of Total Inpatient Days by Product Line and Service (Case Mix)

Product Line	DoD	VA	Total
Behavioral Health	5%	53%	21%
Medicine	24%	29%	25%
Surgery	28%	18%	25%
Ob/Newborn	43%	0%	28%
	100%	100%	99%

Totals are less than 100% due to rounding

Based on the enrolled populations of the two systems, and using the patient classification system to identify the Veterans using the DoD facilities, there are the following *direct care* use-rates per 1,000 enrolled. Based on the enrolled populations of the two systems, there are the following *direct care* use-rates per 1,000 enrolled. This means these use rates exclude the purchased care/fee basis care—so it reflects only the use of the MTFs and VA facilities. In the DoD, 31% of the total number of users in this market accessed the purchased care system—and those users’ activity is not reflected in these use rates. (In the VA, 18% of total users accessed fee-basis care). Also, the inpatient days for the VA are skewed due to the high number of behavioral health days. Nonetheless, the table below shows clearly the difference in patient profile between the DoD and VA. The VA direct care use rates for patient care days are not very dissimilar from the other two markets. The Gulf Coast had higher Medicine Days use rates—but half of their days were Rehab.

Table 81: Percent of Total Inpatient Days by Product Line and Service (Case Mix)

Product Line	DoD	VA	DoD/VA Combined
Behavioral Health	9.68	364.50	54.73
Medicine	46.38	198.52	65.70
Surgery	55.90	125.37	64.72
Ob/Newborn	84.56		73.82
Total	196.52	688.39	258.97

Note that in addition to the workload described about, users from the Hawaii Market generated 138 Extended Care direct care discharges and approximately 13,800 Extended Care direct care inpatient days. It was noted during the site visits that access to long term care is a challenge for the VA.

4.2.2 Inpatient: Indirect Care

Indirect Inpatient care is measured in DRG’s for both DoD and VA. Note that a lot DRGs were coded to 000—and that volume is categorized as “Other.”

The DoD is the primary purchaser of indirect care in all Markets. Excluding “Other”, the largest volume of indirect inpatient care is in Medicine and Surgery. When looking at the HCSR claim detail for DoD it appears that in the “Other” category, at least an additional 148 discharges were Medicine, 112 were Newborn, 128 were Behavioral Health, and 28 were Surgery (the remaining 700 discharges in “Other” could not be further classified). The average length of stay for all indirect care in this Market was 7.7 days. The indirect inpatient admission use rate per 1,000 enrolled beneficiaries was 8.4 for DoD and 11.7 for VA. The VA use-rate is almost 4 times higher than the other Markets.

The majority of the VA activity was for Priority Groups 1 and 5, and the majority of inpatient activity for the DoD was nearly evenly split between Active Duty Family Members, Retiree, and Retiree Family Members. When the DoD activity is broken down by age, it is revealed that 36% of the discharges were for people over the age of 65—most likely TRICARE for Life enrollees. This is different than in the other Markets, where at least 50% of the discharges were for people over the age of 65.

4.2.3 Outpatient: Direct Care

Residents of the Hawaii Market area generated nearly 1 million direct care visits. This activity includes visits to providers, diagnostic departments (such as lab and x-ray), therapeutic departments (such as radiation therapy, physical therapy), and emergency departments, and includes out-migration. When some specialties such as optometry, dental, audiology, ED, diagnostics and therapeutics are excluded (in order to focus mostly on medical/surgical ambulatory provider activity), there were about 800,000 direct care ambulatory visits to providers in Behavioral Health (including substance abuse), “Distinctive Programs” (such as Underseas Medicine & Flight Medicine), Medical Specialties (including rehab), Ob/Gyn, Surgical Specialties, and Primary Care.

The following observations focus on the 800,000 non-diagnostic and non-therapeutic visits. Of this, 87% (or about 691,000 visits) were DoD and 13% were VA. The majority of all visits in any Product Line were generated by the DoD. This profile is quite different from the other two Study Markets, where roughly 30% of Behavioral Health, 70% of Surgical Specialty and 60% of Medical Specialty direct care visits were DoD.

Table 86: Workload by Product Line

Product Line	DoD	VA	Total	% DoD	% VA
Behavioral Health	88,684	31,750	120,434	74%	26%
Distinctive Programs	15,311	0	15,311	100%	0%
Medical Specialty	84,222	16,932	101,154	83%	17%
Ob/Gyn	73,278	0	73,278	100%	0%
Primary Care	355,502	55,542	411,044	86%	14%
Surgical Specialty	74,216	2,533	76,749	97%	3%
Total	691,213	106,757	797,970	87%	13%

As seen in the case mix table below, of the subset of direct care outpatient visits described above generated by Combined Beneficiaries from this market, 52% were for Primary Care (which includes Internal Medicine, Pediatrics, Family Practice, and VA Women’s Health), 15% for Behavioral Health, 10% for Surgery/Surgical Specialties, 13% for Medical Specialties, and 9% for Ob/Newborn. Note that the case mix for DoD and VA are fairly similar—except for Behavioral Health.

Table 87: Percent of Total Ambulatory Visits by Product Line and Service (Case Mix)

Product Line	DoD	VA	Combined
Behavioral Health	13%	30%	15%
Distinctive Programs	2%	0%	2%
Medical Specialty	12%	16%	13%
Ob/Gyn	11%	0%	9%
Primary Care	51%	52%	52%
Surgical Specialty	11%	2%	10%
	100%	100%	100%

Totals exceed 100% due to rounding

Direct care use rates per 1,000 enrolled population also show that the VA enrolled population uses the direct care system at about the same rate as does the DoD. This is different than the other two Study Markets, where the VA had much higher use rates than the DoD. In Hawaii, the VA has lower direct care use rates than in the other Markets (3,600 per 1,000 compared to 4,600 in Gulf Coast and 4,800 in Puget Sound). Also in Hawaii, the DoD has higher direct care use rates than the other Markets (3,400 per 1,000 compared to 2,600 in Gulf Coast and Puget Sound). This is most likely related to the use of indirect care: the percent of DoD users who accessed purchased care was lower in the Hawaii Market than the other two Markets. Likewise, the percent of VA users who accessed fee basis care was higher in Hawaii.

Table 88: Direct Care Outpatient Visit Use Rates per 1,000 Enrolled Population

Product Line	DoD	VA	Total DoD/VA
Behavioral Health	435	1,072	516
Distinctive Programs	75	0	66
Medical Specialty	413	572	434
Ob/Gyn	360	0	314
Primary Care	1,745	1,875	1,762
Surgical Specialty	364	86	329
Total	3,393	3,604	3,420

When viewed from the perspective of the *facility* (rather than the market), the facilities in the Gulf Coast Market saw more than 1.1 million direct care visits to providers, diagnostics, therapeutics, and emergency departments—including in-migration from other markets. Thirty-eight percent of the total outpatient activity supported by the facilities in the market was Primary Care, 19% was Medical Specialty (including Rehab), 12% was Behavioral Health, and 14% was “Outpatient Specialty” (a combination of dental, optometry, audiology, geriatrics, emergency department, home care and nutrition).

The greatest amount of activity was in the Clinical Service Lines of Internal Medicine (189,000 provider, diagnostic, and therapeutic visits), Family Practice (143,000 provider, diagnostic, and therapeutic visits), Mental Health (103,000 provider, diagnostic, and therapeutic visits), and Rehab (112,000 provider, diagnostic, and therapeutic visits). These four Clinical Service Lines represent nearly 50% of the total activity provided by the facilities.

The combined workload of all the facilities in this market is distributed as follows:

Table 89: Activity by Facility

Facility Name	% of workload
Tripler AMC	49%
Schofield Barracks	12%
VAMROC	10%
NMCL Pearl Harbor	10%
15th Med Group Hickam	5%

4.3

4.4 Supply

4.4.1 Key Productive Spaces

Within a complex hospital, there are only a few areas that generally are considered the key productive spaces. Although the hospital provides a wide range of services, the major drivers of space and capacity tend to be inpatient beds, outpatient exam rooms, operating rooms, and diagnostic imaging equipment. As stated previously, in order to facilitate investigation of sharing opportunities, the two Departments should work diligently to develop standards and definitions for measuring the supply of these spaces and converting them into capacity

Since both the DoD and VA use 85% inpatient bed occupancy as a planning standard for Medical/Surgical beds, and 65% occupancy is a commonly accepted high level critical care standard, this Study did an initial assessment of Medical/Surgical, Psychiatry, and Critical Care bed capacity versus demand. The market has 190 staffed beds and 223 available beds in these categories. In 2002 Tripler had a weighted average staffed-bed occupancy of 63%.

Table 91: Productive Spaces

Market	Facility Name	Unit Type	2002 Acute Care Patient Days (Non-OB) Workload	(1)Patient Days Capacity (Staffed Beds) 85%/65%	(1) Patient Days Capacity (Available Beds) 85%/65%	Weighted Occupancy Target	(2)Actual Occupancy (Staffed Beds)	(2) Actual Occupancy (Available Beds)
Hawaii Total	Tripler AMC	Med/Surg	32,584	47,724	56,575	0.82	58%	47%
	Tripler AMC	DoD IP Psych	2,054	4,654	4,654	0.85	38%	38%
	Tripler AMC	VA IP Psych (3)	8,799	6,205	6,205	0.85	121%	121%
	Hawaii Total		43,437	58,583	67,434		63%	53%

Notes:

- (1) Capacity based on bed counts provided from surveys and site visits. Capacity is bed count x 365 x 85% for Medical/Surgical regular, telemetry, and psych or 65% for Critical Care
- (2) Actual occupancy is calculated as 2002 workload/(365*beds). (It does not first reduce capacity by 85% or 65% as in the capacity calculations). Current beds counts (used for "capacity") might be slightly different than bed counts in 2002 (data used for workload). Weighted occupancy target based on % of staffed beds that are regular/telemetry versus critical care. Patient Days exclude OB, Nursery, Rehab, Extended Care, Rehab, SCI. Patient days include in-migration. Patient Days exclude observation care. Med/Surg is combination regular, telemetry, and critical care. Tripler staffed ICU beds (5) seemed to be an error, so weighted occupancy target is based on available beds rather than staffed
- (3) Tripler VA Psych days are a sum of the days that show up in VA and as Vets (K-61) in the DoD data

Facility Condition

Since TAMC recently completed a facilities master plan, architects and engineers from the project team did not complete cursory evaluations of the major clinical buildings in the Hawaii Market (as was done in the other Markets). However, some summary level information about Tripler is in the Attachment to this Appendix.

Access

Drive time analysis in Hawaii is limited to drive time within each island. In Oahu, all enrollees are within 60 minutes of a facility within their system. In the other Submarkets, only the VA beneficiaries are within 60 minutes of a facility. Although the DoD population in the other Submarkets is small, opening the VA to these beneficiaries would improve their access.

Costs

The total costs that were incurred by DoD and VA in FY02 to fund the care required by the Hawaii study market beneficiaries represent the current baseline total annual system costs for the Hawaii market. This is the annual cost required to fund the care provided to the Combined Beneficiary population in the Hawaii study market and includes all direct care provided directly by DoD and VA facilities as well as indirect care purchased by DoD and VA for these beneficiaries. The baseline cost performance for the Hawaii study market is illustrated in the table below.

Table 92: Costs in the Hawaii Market Area

(1) Market enrollees and market users for FY2002 extracted from the Joint Assessment Study Series 4 Database

The Hawaii study market current baseline annual costs summarized above provides a high level perspective of the total costs for delivering inpatient care and outpatient care, in the aggregate for the entire study market. These inpatient and outpatient costs can also be broken down by Product Line as illustrated in the tables that follow.

Table 93: Costs by Product Line

Baseline Total Annual Cost to Deliver Inpatient Care to DoD and VA Beneficiaries in Reside in the Hawaii Market (FY2002)												
Figures in Thousands ('000s)	Direct Care In-Market			Direct Care Out-Migration			Non-Direct (Purchased) Care			FY 2002 Total

Extended Care	-	-	-	-	-	-	11,598	-	11,598	11,598	-	11,598
Total	153,434	49,457	202,891	3,833	490	4,323	23,609	1,725	25,334	180,876	51,672	232,548

The cost data available for the Hawaii market can be used to calculate the current baseline cost performance for specific sub-segments of each study market, such as select geographic submarkets, for select beneficiary populations, and for select Product or Clinical Service Lines.

4.5 Findings from the Application of the Study Methodology to the Opportunity to Recapture Indirect Care

The geography of the islands and the distance from the mainland makes out-migration to other DoD or VA facilities less feasible than in other regions. Thus, in situations where the existing DoD or VA facilities cannot provide care, the Departments must purchase the needed care from the private sector.

As stated in other sections of this report, there are opportunities for the DoD and VA in Hawaii to improve their performance in clinical and business processes: coordination of care, utilization review, and clinical resource management. In purchased clinical services where there are high volumes, complaints about poor access, and/or high costs, the two Systems could work together to recruit specialists to serve the Combined Beneficiaries in Hawaii.

As an attempt to gauge the amount of care that is provided by non-federal providers, Mitretek Systems analyzed the outpatient indirect care for the DoD and VA in Hawaii. The level of detail in available in this report *highlights* the levels of activity—but more analysis would be required in order to isolate volume for the purposes of physician planning.

Table 94: Outpatient Indirect Care Volume by Product Line

Product Line	DoD	VA	Total
Behavioral Health	14,808	602	15,410
Medical Specialty (incl. rehab)	33,256	19,240	52,496
Ob/GYN	5,074	0	5,074
Outpatient Specialty	8,469	45	8,514
Primary Care	93,360	1,786	9,5146
Surgical Specialty	15,330	6,170	21,500
Total	170,297	27,843	198,140

Note: much of the DoD Primary Care activity is from the managed care support contracts for this service⁵³

When broken down by Clinical Service Line, there are some specialties where the combined indirect care activity of the two systems might be sufficient to employ a physician jointly in order to improve access for their beneficiaries. Due to the way the data are grouped, much of this “specialty” volume might actually occur in the offices of internal medicine practitioners—particularly for the VA. However, the magnitude of the visit activity in these Clinical Service Lines makes them worthy of additional research. Some of the highest volume Clinical Service Lines include:

Table 95: Outpatient Indirect Care and Direct Care Activity by Selected Clinical Service Line

Clinical Service Line	DoD Indirect Volume	DoD Direct Volume	VA Indirect Volume	VA Direct Volume	Dod % of Total That Is Indirect	VA % of Total That Is Indirect
Cardiology	3,233	17,271	3,610	877	16%	80%
Gastroenterology	2,840	4,438	2,038	2,174	39%	48%
Nephrology	821	7,027	3,797	299	10%	93%
Neurology	1,550		848	1,378	100%	38%
General Surgery	2,122	8,432	1,648		20%	100%
Orthopedics	3,318	31,806	2,474	2,143	9%	54%
Dermatology	3,163	10,837	350	777	23%	31%

It is interesting to compare the indirect care volumes to the direct care volumes in these Clinical Service Lines. In Cardiology, Nephrology, and Orthopedics, it is possible that the DoD could recapture their volume without additional providers, because the indirect care activity accounts for 16% or less of the activity. For the VA, however, indirect care accounts for nearly half or more of volume in all of these specialties (however, the specialty volumes for VA include activity that might have occurred with an internal medicine doctor). There is a combined volume of over 5,000 purchased visits in Gastroenterology—sufficient volume to jointly employ at least

⁵³ Managed care support contracts are risk contracts with civilian provider networks to compliment the healthcare services provided in the Military Treatment Facilities.

one physician. Note that for some Clinical Service Lines, such as Surgery and Neurology, 100% of the volume is indirect care for one of the Departments.

Much of the DoD activity is likely to be TRICARE for Life⁵⁴, presuming that most of the activities of patients over the age of 65 represent this category. Twenty-two percent of overall DoD activity is over age 65, and between 24-55% of the activity in the Clinical Service Lines above are over age 65.

It is also interesting to see that the DoD is purchasing the highest volume of care in Mental Health and in Rehab—traditionally two areas of clinical excellence for the VA. It could be worth evaluating whether the VA has capacity to service some DoD beneficiaries in these two services.

Table 96: DoD Outpatient Indirect Care in Select Clinical Service Lines

Clinical Service Lines	Volume
Mental Health	14,808
Rehabilitation	19,431

Overall, the outpatient indirect use rate of visits per 1,000 enrolled population is 836 for the DoD and 940 for the VA. The VA indirect care use rate is more than 60% larger in Hawaii than the other two markets. Of note, for inpatient activity, the indirect inpatient admission use rate per 1,000 enrolled beneficiaries was 8.4 for DoD and 11.7 for VA. The VA use rate is almost 4 times higher than in the other Markets, but the DoD use-rate is 1/3 that of the other Markets. Given the geography of Hawaii, one would expect to see lower indirect care rates than in other Markets since the majority of the population in Hawaii lives near the federal facilities (making access easier/quicker) and there are fewer alternatives for private care in the other islands. If the two Departments work closely to analyze the volume and type of indirect care activity, they might consider joint recruitment in key specialties. As will be discussed in the next section, there is opportunity for DoD and VA in this Market to enhance their collaboration in business processes and leadership/governance. Physician resource management is affected by both of these domains of collaboration and could serve as excellent next step in coordination of efforts.

4.6 Findings from the Assessment Applying the Collaboration Framework

Mitretek found the examination of the of the Hawaii market to be highly instructive in understanding the many dimensions (opportunities and challenges) of collaboration and in aiding the evolutionary development and application of the Study methodology. These dimensions are briefly described below.

The Hawaii market has a history of DoD and VA sharing in various ways over a period of decades. Significantly, a close physical and organizational bond emerged in the mid to late 1990's when the VA, in critical need of replacing obsolete facilities at its downtown Honolulu locations and in serious need of gaining better access to inpatient and specialized care for veterans, moved to The Tripler Army Medical Center site. DoD and VA in cooperation, developed four major capital projects: The Ambulatory Care Center (ACC), The Center for Aging, (CFA), a Parking Garage, and a lease arrangement that placed VA administrative

⁵⁴ TRICARE for Life: New benefits (October 1, 2001) for Medicare-eligible uniformed service retirees (and Medicare-eligible family members). TRICARE is a secondary payer to Medicare.

functions in an entirely renovated wing of the hospital. This transition has been hailed as a major accomplishment and is credited with saving tens of millions of taxpayer dollars in comparison with the alternative of the VA separately building facilities in other locations.

At the time of the first site visit, Mitretek learned of many organizational accomplishments that have occurred in recent years. For example, the DoD and VA have together developed a master sharing agreement that affects more than 25 distinct functions (annexes) and describes policies and procedures used to manage the arrangements. Interviewees frequently cited examples of existing successful shared arrangements to include:

- Emergency Room
- Inpatient Medical Surgical Care (including shared use of hospitalists)
- Inpatient psychiatry
- Dietetics
- Physical plant – housekeeping, security, and plant maintenance.
- The active development of a shared telehealth program (called The Pacific Telehealth Hui).

TAMC and VAMROC officials maintain records on sharing activities and noted that in FY02, reimbursement exchanges between the two organizations totaled approximately \$18M for medical care and \$15M in administrative services. These figures are significant but relatively small in comparison with the combined cost of care rendered to beneficiaries who reside within the market.

First Round Site Visits

Interviews during the first site visits also uncovered a number of issues, concerns, and challenges facing DoD and VA staff as they attempt to address the broad subject of sharing within the Hawaii market. Examples of these include:

- IM/IT incompatibilities are an issue for almost everyone.
- Apparently high support for collaboration at both the national and local levels, but significant breakdowns as decisions move up the chain of command.
- The need for single point responsibility.
- Lack of access to investment in collaborative initiatives and the need to pool financial savings to support other initiatives.
- Significant gap between national, regional, and local leadership (and the front line) related to vision, strategy, and expectations.
- Major differences in the use of language and terminology – Is the goal to cooperate, integrate, consolidate? – What do these terms really mean?
- Mixed feelings regarding whether or not momentum has been lost.
- Different views regarding how the relationship should be structured.
- Strong views on the impact and significantly different missions and culture of the two organizations has on collaboration efforts.
- Much too much time pursuing authorizations and reimbursement.
- Huge need for common policies and standards
- Different medical staff and credentialing processes.
- Frustrations with the lack of useful databases and terminology.

The site visit also revealed that, while there were examples of demand/supply imbalances, most individuals regarded these as subordinate and peripheral to other more compelling sets of issues noted above.

The interview process also uncovered a multitude of opportunities that may be pursued. Some of these relate to continued action or improvement on things that TAMC and VAMROC are already doing; others relate to ideas being planned or in process (such as development of ways to integrate Clinical Service Lines within the Department of Medicine). Additionally interviewees identified many ideas on new actions or activities that the DoD and VA could pursue in the future. (The critical questions on the table were: Which of these initiatives should be preserved? Who is making these decisions? Who is going to be held accountable?)

The field visits further revealed that DoD and VA officials on the Islands were interested in exploring completely new paradigms for improving their relationships and in serving common patient needs located throughout the Western Pacific region. Moreover, leadership had in fact conducted a planning retreat that described a proposed vision or end state that would have TAMC and VAMROC become an integrated academic health care system with one budget, one information system, one Graduate Medical Education program, one research program, one logistic system, and one standard of care etc. Additionally, the leadership of the two organizations wished to develop plans to explore, develop, and fund these notions. DoD and VA officials hoped the Joint Assessment Study could aid in moving the organization forward in these endeavors

Relationship Grid

The relationship assessment tools highlight the many complex issues in sharing and collaboration. The Relationship Continuum Grid for Hawaii highlights the following:

Patient care/clinical/workloads – The assessment involving TAMC and VAMROC indicated that the two organizations are largely Connected for outpatient services and Integrated for inpatient services. Participants emphasized that further analysis of patient care activities by Clinical Service and/or Product Line is possible and would be necessary to depict the true picture of the relationships existing within the patient care domain. Moreover, the patient care/clinical workload are often “constants” in any collaboration or sharing initiative in that they are really the motivating force behind most ideas. In a sense, the other collaboration domains are in service of this domain when talking about the common patient care mission of the two organizations.

Facilities – Participants described their facilities as Connected but not Integrated which reflects how facilities on the site were developed. Clearly, acquisitions of certain equipment and development of facilities should continue to flow from joint capital planning.

Staffing – DoD and VA leadership speak of collaboration on staffing as Integrated, citing many examples such as the joint hospitalist program. At the same time, concerns about recruitment and retention of scarce physician and technical/professional services prompt leadership to recognize that collaboration on staffing can be greatly improved and will require detailed attention to human resource policies, procedures, and practices.

Business and clinical processes – Participants assessed these processes as, at best, Coordinated. For the most part, they are different and supportive of the separate work of the two organizations reflecting entirely different accounting, fiscal, admission/discharge, medical records, and utilization management systems. Actions to improve collaboration in this domain should be a primary focus of the forthcoming Smith Amendment demonstration project.

Management and Governance – Participants scored the domain of Management and Governance as Coordinated, noting that DoD and VA already have two layers of structure in place: an Executive Management Board and a Joint Venture Steering Group. Generally participants regard historical organizational relationships as too often focused on reimbursement matters and the input of the Joint Assessment Study process (both quantitative and qualitative) was helpful in orienting the teams longer range strategic matters as well as continuing to deal with ongoing daily operational concerns.

IM/IT – Participants scored this area as Coordinated, although most participants are highly critical of the lack of interoperability between information systems at the local level. While attainment of this objective will flow from national IM/IT initiatives, the two departments expect to continue to devise ways to communicate electronically in as many areas and activities as possible.

Logistics- The participants scored this area as Coordinated and it is regarded as dependent on national direction.

Education and Training – Participants scored their relationship in this domain as Connected, citing shared access to education programs and use of classroom facilities. There are attempts at collaborating on GME efforts but the programs are largely distinct. Most parties see advantages in improving the triangular relationship between the VA, DoD and the University of Hawaii.

Research – Both the DoD and VA have active research programs which are Separate; each has its own funding sources, which tend to follow different protocols. Participants speak of the ideal state being a unified research capability and the federal approval to construct a single bio-medical research facility on the Tripler campus.

Table 97: Tripler and VAMROC Relationship Continuum Grid

Domain	Separate	Coordinated	Connected	Integrated	Consolidated
Clinical Workload	Insignificant referrals	Regular communications	High numbers of referrals <i>Outpatient</i>	Significant number of referrals as one <i>Inpatient</i>	Uniform care management of all patients
Facilities	Distant	Some sharing where duplication exists	Projects & facilities come from master planning	Many departments share space	One facility or set of facilities
Staffing	Distinct	Support in peaks and valleys	Joint staff planning	Multiple examples of single/joint staffing	Single staffing
Business Processes	Different	Reduce barriers	Work flows understood & acted on	Transparent	Single system
Management/ Governance	No Relation	Joint planning sessions	Overlap of key functions	Overlap of key functions	One place where management occurs
IM/IT	Separate systems	Evidence of "E" exchange of info	Moving toward systems interface	Complete interoperability	One system
Logistics	Little if any exchange	Borrowing, bartering and contractual exchange	Mutual examination of best pricing and service	Selective joint contracting of major areas of procurement	One supply chain
Education & Training	Distinct	Selective exchange of methods	Frequent use of joint programs and curriculum	Most programs and curriculum are same/similar	Unified training
Research	Distinct	Selective exchange of protocols	Joint planning and review of many studies	Significant overlap of protocols and review	Unified

4.7 Recommendations for the Hawaii Market

Mitretek recommends that the two Departments work together closely to analyze indirect care activity—especially in specialties where the combined volume could justify jointly employing a specialist.

During the site visits, the DoD and VA both expressed need for additional specialists—particularly in Gastroenterology, Cardiology, and Dermatology. The Indirect Care analysis underscores the need to collaborate in physician recruitment and employment in these specialties. Mitretek recommends that the two Departments work closely to analyze the volume and type of indirect care activity—especially in specialties where the combined indirect care volume could justify jointly employing a specialist, such as Gastroenterology. This is particularly useful if DoD wishes to recapture the volume of TRICARE for Life enrollees.

For most specialties, the two Systems should first determine whether there is excess provider capacity in either of the Systems.

For example, if DoD has excess capacity in a specialty, it should first attempt to recapture “leaking volume” to use up its capacity. If after recapturing volume, some excess capacity remains, VA could take advantage of this opportunity to reduce fee basis care.

Likewise, the Systems should identify and describe DoD indirect care activity for Mental Health and Rehab and determine whether DoD direct care system has capacity to recapture the purchased services. If so, the DoD should encourage beneficiaries to use the direct care system. If not, the Systems should determine whether VA has capacity to support some of the DoD’s needs.

DoD and VA together should evaluate whether jointly employing specialists will help equalize availability and access.

Because of the dynamic nature of the deployment of DoD specialists, Mitretek recommends that DoD and VA together evaluate whether jointly employing specialists will help even out the availability and access.

Mitretek recommends that, using the Collaboration Framework, the two Systems continue to pursue the 50 plus opportunities identified during the site visit.

However, these efforts need to proceed in an orderly, systematic, and information-driven manner. Leadership of both organizations must remain visionary and revitalize formal joint strategy, business, and facilities planning efforts.

Attachments to the Puget Sound Market Assessment

4. Facility Condition Grid
5. Supply Counts

Options for Sharing/Collaboration Identified

There is a long list of potential sharing opportunities in this market—some of them involve small shifts of volume, while other require much more systematic change. The lists below are recommendations for further assessment—not recommendations for implementation. At the highest level there appears to be opportunity to rationalize and realign primary, specialty, and inpatient care. Overall, there is an opportunity to improve access for the Veterans while providing a more rich case mix of patients for the DoD.

Puget Sound Market: Summary Level Options for Further Analysis

- Rationalize Primary Care
 1. Open PC access across two systems
 2. Right-size capacity after Step 1
 3. Open new primary care access points (DoD/VA)

- Realign of Inpatient and Specialty Care
 1. Open MAMC to I/P VA, excluding behavioral health (underway)
 2. Open NH Oak Harbor to VA
 3. Open NH Bremerton to VA
 4. Open VAMC Seattle to DoD
 5. Right-size capacity after Steps 1-4

- Open Joint Ambulatory Care Center – South Market

- Assess the Department’s current relationships on the “Relationship Grids” and determine whether there are opportunities to achieve better outcomes through different levels of sharing

Summary of General Collaboration Ideas and Opportunities by Category Drawn from Research and Market Site Visits: General

Listed below are examples and representations of joint collaboration/sharing ideas (needs, practices, policies, and plans or initiatives) and opportunities in the study markets. Key X=primary driver; O = secondary driver; all categories may be impacted

Opportunity	PT Care	Facilities	Staffing	Bus/Clin Proc	Gov/Mgmt	IM/IT	Logistic	Education	Research
Develop interoperable IM/IT system	X			O		X			
Coordinate GME training			O		O			X	X

DoD/VA Joint Assessment Study

Site Visit Database Summary

Market: Puget Sound

Submarket: Seattle

Facility: VA Puget Sound Health Care System

Interview Summary

General Statement: VA Puget Sound Health Care System, located in Tacoma at American Lake and in Seattle, on Beacon Hill, is the largest and most comprehensive VA facility in the region. VA Puget Sound provides care to more than 46,000 veterans each year, which equates to more than 11, 000 inpatient visits and over 500,000 outpatient visits. VA Puget Sound is the major referral medical center, serving veterans from Alaska, eastern Washington and Idaho. Referrals are also made from VA medical centers around the country for programs such as the spinal cord injury center of excellence, the bone marrow transplant unit and the residential blind rehabilitation unit. The Seattle Division is the major tertiary care facility including acute care, spinal cord injury unit behavioral health services as well as major outpatient programs. VA American Lake is located in Tacoma and was initially constructed during the 1920's. Current services include neuro-psychiatry, ambulatory services, a nursing home unit, blind rehabilitation services, substance abuse programs and homeless domiciliary care.

Organizational Relationships:

Puget Sound VA Medical System includes a tertiary care facility in Seattle and a facility at American Lake in Tacoma

Oversees

- Shoreline CBOC in Seattle
- Bremerton CBOC

Primary referral center for VISN 20

Major teaching affiliation with UW Medical School and affiliates with Madigan Army Medical Center to provide care to Veterans

Facility is staffed by 2 separate unions as well as GS employees

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
Patient/Clinical Care		
<i>Inpatient</i>		
Medical/Surgical	<ul style="list-style-type: none"> • Inpatient units require additional support space • Insufficient bathing and toilet facilities • Many inpatient units are undersized and lack privacy 	<ul style="list-style-type: none"> • Review inpatient sharing opportunities with DoD
Specialty Care		<ul style="list-style-type: none"> • Investigate opportunities for collaborative center of excellence programs

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
Behavioral Health	<ul style="list-style-type: none"> • Reluctance to mix different (mental health) beneficiary populations 	<ul style="list-style-type: none"> • Consider development of shared mental health programs in selected areas. • Develop strategies that address each populations need using shared resources
Extended Care	<ul style="list-style-type: none"> • Inadequate number of beds resulting in spillover to the private sector 	<ul style="list-style-type: none"> • Evaluate need for additional beds in specified locations
<i>Surgery</i>		
<i>Emergency Department</i>		<ul style="list-style-type: none"> • Moving ER services from AL to Madigan
<i>Outpatient</i>		
Medical Specialties	<ul style="list-style-type: none"> • Insufficient space for current and projected future workload • Incorrectly located Primary Care • Current outpatient areas were formerly inpatient space and lack design characteristics that support outpatient care 	<ul style="list-style-type: none"> • Develop plans that identify and resolve appropriate space required to add services • Review in context of master joint facility planning
Surgical Specialties	<ul style="list-style-type: none"> • Staff reported shortages in oncology, spinal cord injury and amputee programs and mental health • Insufficient space for current and projected future workload 	
Behavioral Health	<ul style="list-style-type: none"> • Reluctance to mix different beneficiary populations 	<ul style="list-style-type: none"> • Consider shared programs for outpatient substance abuse
<i>Ancillary Services</i>	<ul style="list-style-type: none"> • Seattle has 2 Linear Accelerators • Potential to develop a shared radiation program with DoD 	<ul style="list-style-type: none"> • Need to determine site and organizational structure for possible shared radiation oncology service.
<i>Management/Governance</i>	<ul style="list-style-type: none"> • Different missions • Recognize that sharing must be a Clinical Service Line to Clinical Service Line basis 	<ul style="list-style-type: none"> • Review range of opportunities • Develop coordinated strategic planning function serving (West

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
		Sound) VA and military beneficiaries.
<i>Clinical/Business Processes</i>	<ul style="list-style-type: none"> • Incompatible 	<ul style="list-style-type: none"> • Review DoD and VA processes for compatibility
<i>Facilities</i>	<ul style="list-style-type: none"> • Severe space constraints limit sharing opportunities • Research and administrative functions take up clinical space • Location of services in multiple buildings • Many areas have not undergone recent renovation 	<ul style="list-style-type: none"> • Evaluate options to add parking (garage?) • Sharing should be organized around major functions: acute care, pharmacy, logistics, IT, fiscal, education and research • Evaluate functions by location • Develop coordinated DoD/VA master facilities plan that considers reallocation and configuration of space to achieve improved facility use.
<i>Staffing</i>	<ul style="list-style-type: none"> • Facility is staffed by 2 separate unions as well as GS employees resulting in inconsistencies and conflicts within the system and had impact on ability to recruit clinical staff 	<ul style="list-style-type: none"> • Investigate alignment of DoD/VA human resource systems
<i>IM/IT</i>	<ul style="list-style-type: none"> • Lack of coordinated or interoperable information system between DoD and VA. 	<ul style="list-style-type: none"> • Develop integrated comprehensive information system for DoD/VA
<i>Logistics</i>	<ul style="list-style-type: none"> • Insufficient space for current Pharmacy demand • Insufficient Pharmacy waiting space within the facility • Little success in sharing due to lack of standardization • No formal process to share procurement activities • Lack of coordination at “higher” levels 	<ul style="list-style-type: none"> • Potential for shared pharmacy services with DoD • Renew DoD/VA purchasing workgroup • Review “top to bottom” sharing opportunities
<i>Education and Training</i>	<ul style="list-style-type: none"> • VA MDs and UW faculty 	<ul style="list-style-type: none"> • Create joint teaching

DoD/VA Joint Assessment Study

Site Visit Database Summary

Market: Puget Sound

Submarket: North

Facility: Naval Hospital Bremerton

Interview Summary

General Statement:

Naval Hospital Bremerton is a fully accredited hospital offering a wide range of inpatient, primary and specialty out patient services.

The hospital is the host facility for three branch medical clinics, Puget sound Family Residency Program, and the Fleet Hospital Bremerton

The Hospital serves an enrolled population of approximately 22,450.

Organizational Relationships:

Bremerton has relatively little interface with VA patients except for some support in pharmacy and imaging for the local CBOC.

The land and/or ferry access are distant from VAMC Seattle.

Most of the relationships are with Madigan. About 80 providers have dual appointments with Madigan for specialty coverage.

NH Bremerton supports 3 Branch Medical Clinics; BMC Everett, BMC Bangor, and BMC Keyport.

There are relatively few referrals to and from community hospitals

NH maintains a variety of sharing or affiliation agreements with DoD and non DoD organizations.

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
Patient/Clinical Care		
<i>Inpatient</i>		
Medical/Surgical		<ul style="list-style-type: none"> NH Bremerton has capacity to accommodate additional inpatient workloads
Specialty Care		
Behavioral Health	<ul style="list-style-type: none"> Limited access and coverage for patients needing mental health services 	<ul style="list-style-type: none"> There is major opportunity for Mental health sharing with VA and other DoD organizations – perhaps with Madigan
Extended Care		
<i>Outpatient</i>	<ul style="list-style-type: none"> Bremerton CBOC is 	<ul style="list-style-type: none"> Consider

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	in close proximity to the hospital	absorbing all Bremerton CBOC workloads
Medical Specialties		<ul style="list-style-type: none"> • Interviews report sharing opportunity for providing radiation oncology at Bremerton and with Madigan support.
Surgical Specialties	<ul style="list-style-type: none"> • Concerns expressed regarding adequacy of case loads to maintain skills. 	<ul style="list-style-type: none"> • Revisit opportunities for VA referrals to NH Bremerton
Behavioral Health	<ul style="list-style-type: none"> • Limited access and coverage for patients needing mental health services. 	<ul style="list-style-type: none"> • Major opportunity for Mental health sharing with VA and other DoD – perhaps with Madigan
<i>Ancillary Services</i>	<ul style="list-style-type: none"> • Lack of demand (radiology) 	<ul style="list-style-type: none"> • Consider providing further lab and imaging service to local VA patients at NH Bremerton
<i>Management/Governance</i>	<ul style="list-style-type: none"> • Different missions • Recognize that sharing must be on a service line to service line basis 	<ul style="list-style-type: none"> • Develop coordinated strategic planning function serving VA and military beneficiaries.
<i>Clinical/Business Processes</i>	<ul style="list-style-type: none"> • There are no consistent performance measures (VA or DoD or Army or Navy). • Different payment/reimbursement and funding systems • Address patient/staff 	<ul style="list-style-type: none"> • Develop coordinated performance measures.

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	transportation system requirements • Different financial systems - make sharing difficult	
<i>Facilities</i>	• The Hospital was built in 1980 and contains approximately 254,000 square feet on eight floors. The ambulatory care center contains 55,000 square feet on three floors offering abundant natural light and views. • Base access can be a problem especially during times of elevated alerts although an innovative “vehicular triage system” has successfully been employed.	• Review master planning requirements
<i>Staffing</i>	• One of the biggest challenge that Bremerton faces deals with handling medical coverage during deployment of the Fleet Hospital such as occurred during the Gulf War. • Lack of physicians (e.g. radiology) DoD deployment and turnover • DoD deployment and turnover.	• Revisit all elements of physician recruitment and coverage requirements in concert with other DoD and VA facilities.
<i>IM/IT</i>	• Incompatible	• Develop single integrated and interoperable integrated information management

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
		system
<i>Logistics</i>		
<i>Education and Training</i>	<ul style="list-style-type: none"> • Management and handling of GME/relationship between UW/DoD/VA. • Volume of patient episodes necessary to meet GME accreditation 	<ul style="list-style-type: none"> • Consider developing a coordinated plan for GME services with other DoD and VA facilities.
<i>Research</i>	<ul style="list-style-type: none"> • Incompatible 	<ul style="list-style-type: none"> • Consider unified research requirements

DoD/VA Joint Assessment Study

Site Visit Database Summary

Market: Puget Sound

Submarket: North Sound

Facility: Naval Hospital Oak Harbor

Interview Summary

General Statement: NH Oak Harbor provides a wide array of inpatient and outpatient services to military beneficiaries residing in the North Puget Sound region.

Organizational Relationships:

Very little VA sharing-- Only pharmacy scripts.

Transfers made to local hospitals for CT, Nuclear Med and MRI

Serious cases medi-vac to Madigan, Bremerton and other private hospitals. Most are high risk pregnancies

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
Patient/Clinical Care	<ul style="list-style-type: none"> • “Not sure how we should relate to VA except that it makes no sense for disabled vet to travel (to Seattle or elsewhere) for anything that can be done here.” • The opportunities and capabilities for greater sharing /collaboration with private area providers are unclear 	<ul style="list-style-type: none"> • Develop coordinated plan with VA to better serve veterans and military beneficiaries.
<i>Inpatient</i>		
Medical/Surgical		
Specialty Care		
Behavioral Health	<ul style="list-style-type: none"> • Biggest problem seems to be mental health coverage and this is cited as a concern of local veterans 	<ul style="list-style-type: none"> • Develop plan for care of mental health patients in concert with VA and local hospital providers
Extended Care		
<i>Outpatient</i>		
Medical Specialties		
Surgical Specialties		
Behavioral Health	<ul style="list-style-type: none"> • Biggest problem seems to be mental health coverage and this is cited as a concern of local veterans 	<ul style="list-style-type: none"> • Develop plan for care of mental health patients in concert with VA and local hospital providers
<i>Ancillary Services</i>	<ul style="list-style-type: none"> • Lack of imaging capabilities—depend on local hospitals. 	<ul style="list-style-type: none"> • Develop coordinated plan with DoD and community hospital facilities.

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
<i>Management/Governance</i>		
<i>Clinical/Business Processes</i>		
<i>Facilities</i>	<ul style="list-style-type: none"> • Facility challenges being addressed with proposed Milcon 	
<i>Staffing</i>	<ul style="list-style-type: none"> • Staffing is sometimes a problem—often rely on contract services for physician coverage 	<ul style="list-style-type: none"> • Revisit staffing opportunities
<i>IM/IT</i>	<ul style="list-style-type: none"> • Lack of coordinated IM/IT program 	<ul style="list-style-type: none"> • Develop single integrated and interoperable integrated information management system
<i>Logistics</i>	<ul style="list-style-type: none"> • Distances from NH Bremerton make logistical sharing difficult 	
<i>Education and Training</i>		
<i>Research</i>		

DoD/VA Joint Assessment Study

Site Visit Database Summary

Market: Puget Sound

Submarket: South Sound

Facility: Madigan Army Medical Center

Interview Summary

General Statement:

Madigan Army Medical Center serves as the specialty care and tertiary care referral center for all military installations in the Puget Sound area

- Army Hospital with strong affiliation with VA American Lake
- Has joint venture project in place
- Inpatient M/S moving from VA American Lake to MAMC

Hospital has 3 major components

- Bed tower
- Diagnostic and support areas
- Medical Mall

Organizational Relationships:

MAMC is an Army Hospital with a strong affiliation with VA American Lake.

Has joint venture project in place.

All VA emergency care will be provided at MAMC.

Inpatient M/S is scheduled to move from VA American Lake to MAMC in 2003.

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
Patient/Clinical Care	<ul style="list-style-type: none"> • Access to base is a major barrier • Active duty staff has priority for care; others are triaged to the private sector if space or specialists are unavailable • Sharing agreement in place with VA for case management 	<ul style="list-style-type: none"> • Revisit solutions to base access for non DoD patients
<i>Inpatient</i>	<ul style="list-style-type: none"> • Current Joint Sharing Agreements are in place 	<ul style="list-style-type: none"> • Review sharing opportunities in family practice, all ancillary services, surgery and inpatient care
Medical/Surgical	<ul style="list-style-type: none"> • Cardiology • Capacity exists for invasive and non-invasive cardiology without addition of clinical staff; 	<ul style="list-style-type: none"> • Consider shared program with VA and eliminate duplicative service; consider how to incorporate VA staff

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<p>some administrative support would be needed</p> <ul style="list-style-type: none"> • Currently 2 cath labs do 950 cases. Benchmark is 1,000 per room in private sector. • Turnover of resident staff (every 28 days in cardiology) decreases efficiency 	<ul style="list-style-type: none"> • Potential to add mid-level providers
Specialty Care		
Behavioral Health	<ul style="list-style-type: none"> • Willingness to combine DoD and VA patient population. Transfer would provide additional inpatient capacity for other inpatient services 	<ul style="list-style-type: none"> • Review consolidation of MH services on one campus
Extended Care		
<i>Surgical Services</i>	<ul style="list-style-type: none"> • Current operational model indicates long case lengths which limits ability for throughput and increased volume. • Current volume of cardiac surgery is low at both MAMC and VA Seattle. Both sites wish to retain program due to impact on other surgical specialties (e.g. for vascular surgery and back-up for cath labs) 	<ul style="list-style-type: none"> • Potential to increase surgical case volume to 12,000 procedures per year using a conservative benchmark of 1,000 cases per room per year • Explore feasibility of combining cardiac surgery program with the VA program at one facility. Benefits would be consolidation of equipment and staff and improved quality outcomes with increased case volume at one facility
<i>Emergency Department</i>		<ul style="list-style-type: none"> • Plans in process to move VA AL emergency patient to MAMC
<i>Outpatient</i>		
Medical Specialties	<ul style="list-style-type: none"> • Sharing opportunity with VA for audiology and speech services • Currently limited 	<ul style="list-style-type: none"> • Explore development of joint program • Expansion of teleconferencing ability in

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	telehealth services available <ul style="list-style-type: none"> • Capacity to share patient care technology for disease management such as scales for heart patients 	medicine, radiology, psychiatry and education and home monitoring
Surgical Specialties	<ul style="list-style-type: none"> • Shortages exist in several sub-specialties • ENT has sharing agreement with VA because ENT needs more volume 	<ul style="list-style-type: none"> • Develop plan to add new MDs in critical specialties where shortages exist (GI, Dermatology)
Behavioral Health		
<i>Ancillary Services</i>	Radiology <ul style="list-style-type: none"> • Difficulty in recruiting medical staff • PET capability is lacking • Cost of duplicate equipment at 2 facilities • Capacity in Radiology exists MDs read 9,000-1,200/yr (Private sector 12,000-15,000/yr) • Agreement in place with American Lake to do Nuclear Medicine and CT on weekends Pharmacy <ul style="list-style-type: none"> • Resolve differences at national level (contracting, agreement on standards, compatible information systems) • Differences exist between DoD and VA related to co-payment requirements Laboratory <ul style="list-style-type: none"> • Services could be shared 	<ul style="list-style-type: none"> • Add PET as sharing opportunity with VAMC Seattle and other diagnostic modalities • Reduced expense of equipment when sharing and combining services • Potential to share with VA patients • Develop standardized joint formulary • Develop joint mail order program • Develop joint policies and procedures
<i>Management/Governance</i>	<ul style="list-style-type: none"> • Need to develop and operationalize a management and governance structure • Belief that sharing with the VA may not pass the 	<ul style="list-style-type: none"> • Develop coordinated strategic planning function serving VA and military beneficiaries • Expand on DoD and VA

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<p>pain/gain test due to differences in regulations, payment, leadership, etc.</p>	<p>development of a “Balanced Scorecard” concept</p>
<p><i>Clinical/Business Processes</i></p>	<ul style="list-style-type: none"> • Wide variety of opinion regarding what models and metrics were appropriate • Capacity is measured using RVU and RWP and there may be coding inaccuracies. No incentive to code correctly? 	<ul style="list-style-type: none"> • Align business processes • Develop coordinated policies and procedures
<p><i>Facilities</i></p>	<ul style="list-style-type: none"> • Facility is composed of an inpatient bed tower currently operating 140 beds (formerly 500 beds), diagnostic areas and a “medical Mall for outpatient care • Overall the facility is in good condition • Former inpatient beds have been converted to outpatient space creating space that is less functional and uses more space than is required. • Cost would be substantial for any renovation to the existing building • Disruption would be only in the impacted area • Ample space is available for transition • Access to the facility is the biggest barrier to care • New dynamic force protection strategies may further limit access (and parking) in the future 	<ul style="list-style-type: none"> • Additional capacity is available in many areas. Some targeted for new Elder care practice and M/S patients coming from VA AL • Excess capacity (space) exists in Radiology, Family Practice, Cardiopulmonary and Surgery • Review facility sharing opportunities in context of joint DoD/VA master planning
<p><i>Staffing</i></p>	<ul style="list-style-type: none"> • Need to recognize impact of deployment and finite length of assignments for military personnel 	<ul style="list-style-type: none"> • Uniform or universal pay practices to ensure fairness • Align human resources policies

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<ul style="list-style-type: none"> • Staff includes military, civilian, contract and resource sharing employees as well as Red Cross employees. Inequities in pay structures cause difficulties • Concern about ability to compete for staff, especially physicians • Radiologists in short supply for both MAMC and VA (salaries 50% of private sector) • Availability of nursing staff determines number of operational beds 	
<i>IM/IT</i>	<ul style="list-style-type: none"> • Information systems between DoD and VA are not compatible for entering or obtaining patient information 	<ul style="list-style-type: none"> • Develop single integrated and interoperable integrated information management system
<i>Logistics</i>	<ul style="list-style-type: none"> • Capital equipment is old and needs replacement; currently unbudgeted 	<ul style="list-style-type: none"> • Develop long range capital budget planning for new and replacement equipment • Review joint sharing logistic opportunities for sharing
<i>Education and Training</i>	<ul style="list-style-type: none"> • VAMC/ UW (currently a program) willingness to include MAMC in a joint GME program • Additional sharing with VA for educational programs 	<ul style="list-style-type: none"> • Shared GME program with VAMC and UW • Joint Psychiatry residency program with VA • Education through teleconferencing with VA
<i>Research</i>	<ul style="list-style-type: none"> • Differing DoD and VA research protocols and regulations • Funding stream for research is separate and decisions are difficult regarding "who needs to pay?" 	<ul style="list-style-type: none"> • Combine clinical research programs with VA • "Seed" money for capital and transition costs for JV opportunities

DoD/VA Joint Assessment Study

Site Visit Database Summary

Market: Puget Sound

Submarket:

Facility: Everett BMC

General Statement: Provides routine ambulatory health care services to active duty assigned to Naval Station Everett, home ported and visiting ships, commands located in the surrounding areas and their TRICARE PRIME family members. The clinic also provides employee health services, occupational medicine and industrial hygiene to eligible civilian employees and commands. There is a dental clinic.

Organizational Relationship: Operated by Naval Hospital Bremerton

Clinical Service Line/ Department	Key Functional Characteristics/ Barriers to Sharing	Opportunities
Patient/Clinical Care	<ul style="list-style-type: none"> • Access to clinic is through the main gate. • Volume fluctuates widely subject to which ships are in port and creates fluctuation in staffing requirements. • Capacity exists to accommodate increased volume • Everett patients go to Naval Hospital Bremerton for specialty care while VAMC Seattle is closer • Insufficient office space for MDs was cited as an issue 	<ul style="list-style-type: none"> • Potential source of increased volume with addition of VA volume. (VA Clinic with shared ancillaries) • Share VA specialists at this location
Specialty	<ul style="list-style-type: none"> • Identified need for increased mental health services 	

Clinical Service Line/ Department	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<ul style="list-style-type: none"> • Other specialists (orthopedics and dermatology come as needed from Naval Hospital Bremerton • Some family member use the private sector for specialty care • Deployment contributes to staff shortages for both direct care providers and nursing staff 	<ul style="list-style-type: none"> • Collaboration with VA for staff coverage especially during deployment periods
Information Technology	<ul style="list-style-type: none"> • No computerized medical record • No ability to access lab info via CHCS 	<ul style="list-style-type: none"> • Implement information technology solutions
Education	<ul style="list-style-type: none"> • Lack of specialists for education 	<ul style="list-style-type: none"> • Explore potential for VA guest lectures in specialties
Ancillaries	<ul style="list-style-type: none"> • 80% of lab volume goes to Quest • Currently low utilization of pharmacy 	<ul style="list-style-type: none"> • Tests could be sent to VA with good turnaround times. • Provide pharmacy services for retirees and veterans

DoD/VA Joint Assessment Study

Site Visit Database Summary

Market:

Submarket:

Facility: McChord

General Statement:

McChord AFB clinic serves as a medical facility and health care resource to active duty personnel and area enrolled beneficiaries. Facility reports approximately 12,000 with an expected growth to 15,000 enrollees.

Organizational Relationships:

Patients needing inpatient care or specialty services are referred to Madigan. There are reported to be few and infrequent referrals to or from VA facilities. The clinic does fill VA pharmacy prescriptions. The base clinic has been seeing a growth in the number of retirees and those over age 65.

Collaboration Category	Operational Issues/Barriers	Opportunities
Patient/Clinical Care	<ul style="list-style-type: none"> Dependence by veterans has not been tested. 	<ul style="list-style-type: none"> The facility would have the capacity to absorb additional workloads (presumably primary care serving veterans and DoD beneficiaries).
Facilities	<ul style="list-style-type: none"> Base access adjoining is convenient but not direct from Madigan 	<ul style="list-style-type: none"> Conduct access review in concert with Madigan and VA

**DoD/VA Joint Assessment Study
 Site Visit Database Summary
 Market: Puget Sound
 Submarket: West Sound/Bremerton
 Facility: Bremerton CBOC**

General Statement: The clinic provides primary medical and mental health care with full-time VA staff. All specialty care is referred to VA Puget Sound, Seattle Division. The clinic contracts locally for stat lab, urgent pharmacy & routine x-ray services.

Organizational Relationships:

Division/extension of VAMC Seattle
 Minimal sharing w NH Bremerton reported – some pharmacy and lab stat work

Clinical Service Line/ Department	Key Functional Characteristics/ Barriers to Sharing	Opportunities
Patient/Clinical Care	<ul style="list-style-type: none"> • Need for better access for ER and imaging services • Subspecialty access to ophthalmology, orthopedics, mental health, 	<ul style="list-style-type: none"> • Develop plans for increased collaboration and sharing with NH Bremerton: e.g. access to ER services, radiology, pharmacy, and urology • Coordinate subspecialty access to ophthalmology, orthopedics, mental health
Facilities	<ul style="list-style-type: none"> • Currently small clinic with capacity to handle greater workloads 	<ul style="list-style-type: none"> • Consider consolidation at NH Bremerton
Staffing	<ul style="list-style-type: none"> • Currently 2.5 FTE provider and 3.5 FTE overall • Lack of sub-specialists in some areas 	<ul style="list-style-type: none"> • Staffing can be adjusted to work load
IM/IT	<ul style="list-style-type: none"> • IM/IT is reported issue; concern about sharing 	<ul style="list-style-type: none"> • Resolve IM/IT interoperability

APPENDIX A

Attachment I

Clinical Service Line/ Department	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	medical info w DoD	
Logistics	<ul style="list-style-type: none">• Minimal sharing of supplies and equipment	<ul style="list-style-type: none">• Possibly supplies and logistics – how ever concern about VA wide and DoD/VA coordination of purchasing

Functional Assessment Red/Amber/Green Definitions

	Size
G	Area within + 10% of programmed area
A	Area is > + 10% of Prog. Area
R	Area is < + 10% of Prog. Area (GSF), and rooms have specific requirements which are difficult/expensive to repair
	Configuration
G	Configuration appropriate to accomplish mission
A	Not good, but could be easily altered in place
R	Not Configured To do Mission – ex. Department split, patient floor, inappropriate room size
	Location
G	Department located appropriately in building for efficiency and ease of staff and patients
A	Location is not an issue for efficiency and convenience for staff and patients
R	Department location is inconvenient in the building and causes inefficiency for staff and patients
	Adjacency
G	Adjacent to appropriate departments for operational or patient ease/efficiency or can stand independent of other departments
A	Would like certain adjacency but function OK
R	Needs to be located near another department
	Interior – Image
G	Appropriate and up to date
A	Appropriate but appears dated
R	Inappropriate for use
	Interior Condition
G	In excellent condition
A	In fair condition
R	Needs replacement
	ADA Compliance
G	Meets ADA requirements for area and access
A	ADA requirements met through adaptation of space and systems where possible
R	Does not meet ADA requirements

Puget Sound Market Area

DoDVA Joint Assessment Study

Functional Assessments

Below are the results from cursory department tours made by architects on the project team. Only the major clinical buildings were reviewed. The departmental scores (size, configuration, location, adjacency, interior image, interior condition, ADA compliance) are subjectively derived from quick tours of the departments. The information contained in the database is not interchangeable with the level of detail that would be derived from a Facilities Master Plan and/or a Facilities Condition Assessment.

DoDVA Joint Assessment Study **Puget Sound Market Area**
Supply Counts from Site Visits and Surveys

Below are the supply counts and characteristics provided by the sites either in response to a survey or via site visits. DoD sites are in capital letters to help quickly differentiate DoD from VA. Note that "Exam Rooms" cannot be added to derive the total number of exam rooms in a market, since some exam rooms are duplicated between multiple clinics (e.g. if cardiology has 5 exam rooms half of the week and endocrinology has the same 5 exam rooms half of the week, they each are assigned 5 exam rooms)

Puget Sound Market Area

DoD/VA Joint Assessment Study
Building Condition Assessments

Below is information gathered by the engineers on the project team. Building Infrastructure Condition is on a Poor, Fair, Good, Very Good. Excellent subjective scale derived from quick tours of the buildings. Only the major clinical buildings were reviewed. FCI (facility condition index), Plant Replacement Value, and Deferred Maintenance was entered only if provided by the sites. The information contained in the database is not interchangeable with the level of detail that would be derived from a Facilities Master Plan and/or a Facilities Condition Assessment.

FACILITYNAME	BLDG_NAME	BUILDINGID	BLDG_NUM	AGE	BGSF	BNSF	YEAR_BUILT	FCI	REPLACE_VALUE	DEFER_MAINT	CONDITION

Options for Sharing/Collaboration Identified

There is a long list of potential sharing opportunities in this market—some of them involve small shifts of volume, while other require much more systematic change. The lists below are recommendations for further assessment—not recommendations for implementation. At the highest level there appears to be opportunity to rationalize and realign primary, specialty, and inpatient care. Overall, there is an opportunity to improve access for the Veterans while providing a more rich case mix of patients for the DoD.

Gulf Coast Market: Summary Level Options for Further Analysis

- Redistribute, then Right Size Capacity for Primary Care
 1. Open BMCs to VA
 2. Consolidate CBOC Panama City and BMC Panama City
 3. New CBOC at/near Tyndall or open Tyndall to VA
 4. Open Mobile to DoD
 5. New CBOC at/near Eglin or open Eglin to VA

- Realign Inpatient and Specialty Care
 - A. Biloxi/Gulfport Submarket – Multiple Options:
 1. Transfer all Medical/Surgical Inpatient Care from Biloxi to Keesler
 2. Transfer all Medical/Surgical Inpatient Care from Keesler to Biloxi
 3. Close BMC Gulfport and shift behavioral health services to Biloxi or Keesler
 4. Build New DoD/VA Federal Hospital to Replace:
 - a) Keesler and Biloxi, *or*
 - b) Keesler, Biloxi and BMC Gulfport
 - B. Eastern submarket options:
 5. Expand /enhance VA access to NHP specialty and I/P care
 6. Expand/open/enhance VA access to Eglin specialty and I/P care

- Assess the Departments current relationships on the “Relationship Grids” and determine whether there are opportunities to achieve better outcomes through different levels of sharing

Summary of General Collaboration Ideas and Opportunities by Category Drawn from Research and Market Site Visits: General

Listed below are examples and representations of joint collaboration/sharing ideas (needs, practices, policies, and plans or initiatives) and opportunities in the study markets. Key X=primary driver; O = secondary driver; all categories may be impacted

Opportunity	PT Care	Facilities	Staffing	Bus/Clin Proc	Gov/Mgmt	IM/IT	Logistic	Education	Research
Develop interoperable IM/IT system				O		X			
Coordinate GME training	X		O		O			X	X
Develop coordinated QM/QI functions				X					
Develop coordinated Utilization Management system				X					
Develop useful balanced scorecard of collaboration relationships				X					
Pursue coordinated offering of primary care	X		O						
Consolidate inpatient (M&S) services at one site	X								
Coordinate research programs			O					X	X
Develop comprehensive free standing VA/DoD Ambulatory Care Center (ACC)	O	X							
Consolidate Ancillary Services - Radiology/Imaging	X	O							
Consolidate Ancillary services - laboratory/pathology	X	O							
Coordinate placement of VA CBOCs with DoD	O	X							
Develop uniform approach to managing patient (medical records)				X		O			
Offer single VA/DoD pharmacy formulary				O			X

Culminate strong leadership to build on collaboration opportunities	X		X	X	X
Expand VA and DoD quality measurement initiatives	X		X	X	X
Develop joint credentialing program	X		X	X	X
Develop joint rehabilitation programs (PT, OT, cardiac)	X	X	X	X	X
Expand radiology and teleradiology capabilities to compensate for shortages of physicians and technicians	X		X	X	X
Develop joint education and training programs	X		X	X	X
Develop CBOC near Eglin	X				X
Develop sharing agreements in an incremental manner and responsive to real needs					X
Develop stronger joint GME programs that answer both training and readiness requirements	X		X	X	X
Develop programs that consolidate inpatient care, mental health and ancillaries for both populations	X		X		X
Offer MRI and cardiac cath in eastern (panhandle) markets at Eglin and Pensacola vs. relying on the private sector				X	X
Develop joint research programs between VA and DoD	X		X	X	X
Conduct joint research projects to discover best and most effective performance measurement indicators	X		X		X
Develop quality measures based on the metrics of "time spent with patients" These can be normalized for both VA and DoD	X		X		
Develop health care delivery access using med evac capabilities of the three military services	X		X	X	X
Consider the Gulf Coast as a linear market with pockets of VA and DoD populations	X		X	X	X

DoD/VA Joint Assessment Study

Site Visit Database Summary

Market: Gulf Coast

Submarket: Biloxi/Gulfport

Facility: Keesler AFB

Interview Summary

- **General Statement:** Home to 81st Medical Group
- Second largest medical center in the Air Force.
- Keesler AFB offers a wide array of inpatient, outpatient, and specialty care services
- Serves more than 56,000 beneficiaries within a 40-mile catchment area
- Staff of more than 2,100
- Maintains active graduate medical education and research programs.

Organizational Relationships: Keesler maintains multiple inpatient, outpatient, and ancillary service sharing arrangements with Biloxi VAMC. Mental health sharing agreements exist with VA Gulfport.

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
<p>Patient/Clinical Care</p>	<ul style="list-style-type: none"> • The military has need for a challenging patient load, which the VA population can provide. Their patients are chronic, with multiple diseases and have terrific academic links. • It is fundamental that military and veteran beneficiaries should have reasonable access to any military or VA facility that is located along the coast. • The VA needs the access to care and the capital infrastructure, which the military health system can provide. • It is reported that many veterans are moving to this region creating an influx of demand for care, which may be best met by military assets. • The needs of each specialty are different and no one solution is going to work for all services. • Adjacent but separated VA and military outpatient facilities on campus of a medical center is 	<ul style="list-style-type: none"> • Develop joint GME Programs • Placement of services that are accessible to all beneficiaries • Develop joint staffing model and place VA and active duty patients as appropriate

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	desirable. but different facilities to care for mental health patients should be assigned to the VA and obstetrics and pediatrics should be assigned to the military.	
Medical/Surgical	<ul style="list-style-type: none"> Some inpatient services such as medicine and surgery could be shared. 	<ul style="list-style-type: none"> Opportunity for increased collaboration with the VA for inpatient services including intensive care assignment of personnel and technical equipment
Specialty Care	<ul style="list-style-type: none"> The cardiovascular Center of excellence at Keesler is dependent upon a greater number of patients than exists in which can be supplemented through the air evacuation program serving both federal (VA and military) and civilian population. Demand and utilization suggests that DoD and VA should consider having a joint center of excellence program in cardiovascular services 	<ul style="list-style-type: none"> Provide referrals to augment Keeslers programs. Develop joint Center of Excellence with both DoD and VA patients.
<i>Outpatient</i>	<ul style="list-style-type: none"> Physical therapy and emergency services can be subject to much more effective collaboration. 	<ul style="list-style-type: none"> Develop joint programs and processes
Medical Specialties	<ul style="list-style-type: none"> Opportunities exist for greater collaboration in offering radiation oncology 	<ul style="list-style-type: none"> Consider development of joint programs
Surgical Specialties	<ul style="list-style-type: none"> Capacity exists in outpatient surgery 	<ul style="list-style-type: none"> Joint outpatient surgery
Behavioral Health	<ul style="list-style-type: none"> Sharing activity with the VA has focused primarily on mental health. 	
<i>Ancillary Services</i>	<ul style="list-style-type: none"> Better sharing of laboratory referrals and joint acquisition of blood and blood products can be worked out. Shortage of Imaging physicians and technicians identified as an issue 	<ul style="list-style-type: none"> Develop collaborative programs Expand radiology and teleradiology capabilities to compensate for shortages of physicians and technicians

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
<i>Management/Governance</i>	<ul style="list-style-type: none"> • Where personalities mesh, there are good examples of effective collaboration. More often however, individuals within a command structure in the military or network executives within the VISN can reject or overrule sharing initiatives. This can hold true for any of the military services. Sharing agreements can be canceled with us 30 to 60 days notice. • The guidance from national authorities on the sharing program have been inconsistent and often contradictory leaving it to local authorities to figure out how best to shape sharing activities in terms of patient referrals 	<ul style="list-style-type: none"> • The success is dependent on a win/win philosophy. • Strategic plan coordination with the VA should serve as the foundation for all performance measurement activities affecting collaboration activities. • Take advantage of strong leadership that currently exists to build on collaboration opportunities
<i>Clinical/Business Processes</i>	<ul style="list-style-type: none"> • Determinations of benefits are not uniform. It was noted that dental benefits are widely different between V. A. and department of defense • Real quality can be effectively measured by the “time” a clinician spends with a patient and measurements should be focused on this objective. DoD and VA can collaborate on this endeavor. 	<ul style="list-style-type: none"> • Performance measurements reporting and the notion of the balance scorecard reporting between DoD and VA should be investigated • Build upon DoD and VA quality measurement initiatives
<i>Facilities</i>	<ul style="list-style-type: none"> • It was reported that much of the inpatient facilities have been converted to either outpatient functions or to administrative space. • Space shortages are reported to exist in a few areas concentrated in the surgical suite, training and conference space, and in some of the clinics areas. There are also significant areas of unused 	<ul style="list-style-type: none"> • Conduct master facilities plan in coordination with the VA. • Consider closing Gulf Port and operate VAMC Biloxi and Keesler as a two hospital system.

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<p>space.</p> <ul style="list-style-type: none"> • Campus expansion is somewhat limited at the Keesler site, although there is land currently used for base housing that directly abuts the veteran's administration campus. • Access to base is a barrier particularly during times of heightened security 	
<i>IM/IT</i>	<ul style="list-style-type: none"> • IM/IT limit communication of vital information 	<ul style="list-style-type: none"> • Identified need to develop interoperable information management systems
<i>Logistics</i>	<ul style="list-style-type: none"> • Currently there is some sharing that includes laundry services, security, fire and rescue. 	<ul style="list-style-type: none"> • Develop more extensive sharing processes
<i>Education and Training</i>	<ul style="list-style-type: none"> • Currently medical care on the military bases is much less intense than military preparedness should warrant. The veterans provide a population that is challenging to the staff and which can support a meaningful graduate medical education and residency mission. 	<ul style="list-style-type: none"> • Consider much stronger joint GME programs that answer both training and readiness requirements for both agencies • Develop arrangements whereby VA, DoD, and medical schools collaborate in ways that are dynamic and innovative
<i>Research</i>	<ul style="list-style-type: none"> • Currently very little research sharing has occurred with the veterans administration. 	<ul style="list-style-type: none"> • Opportunities exist for greater sharing of research capabilities particularly relating to emergency training and provision of air evacuation capabilities • Develop joint research programs between DoD and VA • Conduct joint research projects to discover best and most effective performance measurement indicators

DoD/VA Joint Assessment Study**Site Visit Database Summary****Market: Gulf Coast****Sub market: Biloxi/Gulfport****Facility: VAMC Biloxi and Gulfport****Interview Summary**

- **General Statement:** The Gulf Coast Veterans Health Care System (GCVHCS) describes itself as having five divisions and is anchored by a two division Hospital – VAMC Biloxi and VA Gulfport. There are 3 CBOC's (Mobile, Pensacola, and Panama City).

Organizational Relationships: 21 documents identifying multiple sharing agreements, MOUs, and planning initiatives that affect:

- VAGCVHCS–Biloxi, 96th Medical Group, Eglin AFB
- VAMC–Biloxi, 16th Medical Group Hurlburt Field
- VAMC–Jackson, MS Naval Hospital Pensacola
- VAMC–New Orleans, 325th Medical Group Tyndall AFB
- VBA–Jackson, 81st Medical Group Keesler AFB
- VBA–Regional Office, St. Petersburg Armed Forces Retirement Home
- VBA–New Orleans, US Navy Retirement Home
- 13 DoD/VA Sharing agreements in place with six military facilities
- Agreements include selling, buying and sharing of staff, space, clinical and non-clinical services
- \$1,659,976 Total DoD/VA Sharing FY 02
- \$ 1,991,625.96 DoD/VA Sharing FY 03 through April 2003

DoD/VA Joint Assessment Study**Site Visit Database Summary****Market: Gulf Coast****Submarket: Pensacola****Facility: NH Pensacola****Interview Summary**

General Statement: NH is a full service medical center offering a wide array of inpatient, outpatient, and ancillary services. It is responsible for ten (10) branch medical centers, of which seven (7) are located in the Gulf Coast market area and three (3) are located in other markets.

Descriptive features of NH Pensacola include:

- Sixth Naval medical facility built in the US
- Existing 8-story, 60-bed hospital (sixth construction) opened in 1976.
- First MTF to be built off base.
- Operates 10 Branch Medical Clinics (BMCs)
- NH and BMCs serve 20,000 active duty and 74,000 family members and retirees
- Family practice residency training program
- Fleet Hospital on-site (900 personnel)
- New Outpatient Clinic opened in January 2002
- Six new maternity suites were opened in March 2002 (currently 600 deliveries per year at NH)

Organizational Relationships: NH Pensacola maintains a number of resource sharing agreements with VAGCVHCS affecting the following Services: Inpatient ,Emergency ,Radiology, Orthopedics, Other Outpatient (e.g. Ophthalmology, Neurology, ENT),Pharmacy, Mental Health, and Laboratory

NH Pensacola and VA have been actively engaged in planning an outpatient ambulatory care center to be sited somewhere in the Pensacola area.

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
Patient/Clinical Care	<ul style="list-style-type: none"> The biggest opportunity for VA is to gain access to DoD (inpatient and outpatient facilities) in the eastern portion of the market (Florida Panhandle). 	<ul style="list-style-type: none"> Develop health care delivery access using med evac capabilities of the three military services

DoD/VA Joint Assessment Study

Site Visit Database Summary

Market: Gulf Coast

Submarket: Eglin

Facility: Eglin AFB

Interview Summary

General Statement: Eglin AFB Medical Center is a full service facility offering a wide array of inpatient, outpatient, and ancillary services. The Eglin Air Force Base covers over 700 square miles. It is anticipated that the military mission will continue, if not grow for the foreseeable future

Organizational Relationships: Eglin AFB Medical Center maintains or is engaged in a number of resources sharing agreements or planning initiatives with VAGCVHCS including: compensation and pension examinations, and ENT consults.

Eglin AFB and VAGCVHCS are currently planning for development of an approximate 15,000 SF CBOC that will be located near but outside the gates of Eglin medical center. It is anticipated that the CBOC will procure some services from Eglin including radiology, laboratory, and pharmacy services.

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
<p>Patient/Clinical Care</p>	<ul style="list-style-type: none"> The biggest opportunity for VA is to gain access to DoD (inpatient and outpatient facilities) in the eastern portion of the market (Florida Panhandle). Congress usually wants to “solve the dual eligible question”. It is a highly sensitive issue and the numbers should be sorted out. There is need to distinguish patient and clinical care services that can be candidates for VA DoD collaboration 	<ul style="list-style-type: none"> Develop unified strategic plan with VA to serve VA and military beneficiaries residing in the eastern areas of the Gulf Coast market. Develop a unified data base that identifies dual user utilization. Opportunities exist for Eglin Air Force Base hospital to do all inpatient, mental health, and ancillary services. Outpatient primary and

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<ul style="list-style-type: none"> VA needs military infrastructure capabilities and military needs VA patient mix 	<p>specialty care can continue to be separated. However, with two huge systems starving for funds, it is very important that every effort be made to improve sharing and collaboration.</p> <ul style="list-style-type: none"> Collocate DoD and VA primary care services at Eglin and Tyndall AFB.
<i>Inpatient</i>	<ul style="list-style-type: none"> There have been mixed and uneven levels of satisfaction with various services that are referred to community hospitals. 	<ul style="list-style-type: none"> Concentrate on improving DoD and VA patient services that depend on community hospitals as second order back up facilities.
Behavioral Health	<ul style="list-style-type: none"> Currently mental health patients are sent downtown and there are no provisions in the MILCON to accommodate mental health patients at this time 	<ul style="list-style-type: none"> Develop unified mental health plan with VA to serve mental health patients in the eastern areas of the Gulf Coast market.
<i>Outpatient</i>	<ul style="list-style-type: none"> There is need for building a VA accessible CBOC near the Eglin Air Force Base hospital. 	<ul style="list-style-type: none"> CBOC is being planned to be located outside the gates so as to be accessible to the veterans.
<i>Ancillary Services</i>	<ul style="list-style-type: none"> Lack of radiologists force us to rely on contractors and private providers. 	<ul style="list-style-type: none"> Offer MRI and cardiac cath in eastern (panhandle) markets at Eglin and Pensacola vs. relying on the private sector Expand radiology and teleradiology capabilities to compensate for shortages of physicians and technicians
<i>Management/Governance</i>	<ul style="list-style-type: none"> For sharing to be successful, it is important to develop memorandums of understanding in "real-time" and do it in an evolutionary manner rather 	<ul style="list-style-type: none"> Conduct "pilot studies" and then prepare DoD/VA collaboration initiatives based on tested experiences in order to gain support and achieve most effective

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<p>than trying to anticipate all possible outcomes.</p> <ul style="list-style-type: none"> Barriers almost always can be traced to leadership philosophy towards collaboration. A win - win attitude is key 	<p>outcomes.</p> <ul style="list-style-type: none"> Governance and leadership is the key to success. Every effort must be made to cultivate senior leadership and the rest will follow. Take advantage of strong leadership that currently exists to build on collaboration opportunities
<i>Clinical/Business Processes</i>	<ul style="list-style-type: none"> Quality has several elements including education and training, risk management, safety management, credentialing, and infection control. Efforts are underway at Eglin to combine these qualitative activities in an organized fashion. The interviewee believes that orientation and training is the key to any quality program. In terms of performance measurement, interviewee believes this is essentially a decentralized process. it should be handled at the service line or departmental level using multiple sets of criteria meaningful to those actually rendering the care. 	<ul style="list-style-type: none"> Opportunity exists for DoD and VA. quality initiatives to be worked out in a coordinated fashion. Opportunity for shared transportation systems Opportunity to build upon DoD and VA quality measurement initiatives
<i>Facilities</i>	<ul style="list-style-type: none"> Access to base is a barrier particularly during times of heightened security 	<ul style="list-style-type: none"> Develop access plan for veterans
<i>Staffing</i>	<ul style="list-style-type: none"> Staffing is the limiting factor in most instances. There are deficiencies in some sub specialties 	<ul style="list-style-type: none"> Review opportunities to share staff (e.g. VA ENT physician at Eglin.)
<i>IM/IT</i>	<ul style="list-style-type: none"> It is imperative to solve the information systems "lack of interoperability" or "all bets are off". 	<ul style="list-style-type: none"> Pursue development of interoperable IMIT system

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
<i>Education and Training</i>	<ul style="list-style-type: none"> Education, patient care, and readiness missions are key to military medicine key and may be met through VA relationships. 	<ul style="list-style-type: none"> Revisit entire GME requirements in the context of a stronger and different educational relationship with VA including possible controlled embedding of the GME program in VA facilities, Develop joint education and training programs
<i>Research</i>	<ul style="list-style-type: none"> Separate DoD and VA research activities 	<ul style="list-style-type: none"> Develop joint research programs between DoD and VA Conduct joint research projects to discover best and most effective performance measurement indicators

Functional Assessment Red/Amber/Green Definitions

	Size
G	Area within $\pm 10\%$ of programmed area
A	Area is $> + 10\%$ of Prog. Area
R	Area is $< \pm 10\%$ of Prog. Area (GSF), and rooms have specific requirements which are difficult/expensive to repair
	Configuration
G	Configuration appropriate to accomplish mission
A	Not good, but could be easily altered in place
R	Not Configured To do Mission – ex. Department split, patient floor, inappropriate room size
	Location
G	Department located appropriately in building for efficiency and ease of staff and patients
A	Location is not an issue for efficiency and convenience for staff and patients
R	Department location is inconvenient in the building and causes inefficiency for staff and patients
	Adjacency
G	Adjacent to appropriate departments for operational or patient ease/efficiency or can stand independent of other departments
A	Would like certain adjacency but function OK
R	Needs to be located near another department
	Interior – Image
G	Appropriate and up to date
A	Appropriate but appears dated
R	Inappropriate for use
	Interior Condition
G	In excellent condition
A	In fair condition
R	Needs replacement
	ADA Compliance
G	Meets ADA requirements for area and access
A	ADA requirements met through adaptation of space and systems where possible
R	Does not meet ADA requirements

Key: G=Green, A=Amber, R=Red

DoDVA Joint Assessment Study
Functional Assessments
Gulf Coast Market Area

Below are the results from cursory department tours made by architects on the project team. Only the major clinical buildings were reviewed. The departmental scores (size, configuration, location, adjacency, interior image, interior condition, ADA compliance) are subjectively derived from quick tours of the departments. The information contained in the database is not interchangeable with the level of detail that would be derived from a Facilities Master Plan and/or a Facilities Condition Assessment.

DoD/VA Joint Assessment Study
Building Condition Assessments

Below is information gathered by the engineers on the project team. Building Infrastructure Condition is on a Poor, Fair, Good, Very Good, Excellent subjective scale derived from quick tours of the buildings. Only the major clinical buildings were reviewed. FCI (facility condition index), Plant Replacement Value, and Deferred Maintenance was entered only if provided by the sites. The information contained in the database is not interchangeable with the level of detail that would be derived from a Facilities Master Plan and/or a Facilities Condition Assessment.

FACILITYNAME	BLDG_NAME	BUILDINGID	BLDG_NUM	AGE	BGSF	BNSF	YEAR_BUILT	FCI	REPLACE_VALUE	DEFER_MAINT	CONDITION
16th MED GRP-HURLBURT FIELD	Clinic	212			69000		1992				Very Good

DoD/VA Joint Assessment Study **Gulf Coast Market Area**
Supply Counts from Site Visits and Surveys

Below are the supply counts and characteristics provided by the sites either in response to a survey or via site visits. DoD sites are in capital letters to help quickly differentiate DoD from VA. Note that "Exam Rooms" cannot be added to derive the total number of exam rooms in a market, since some exam rooms are duplicated between multiple clinics (e.g. if cardiology has 5 exam rooms half of the week and endocrinology has the same 5 exam rooms half of the week, they each are assigned 5 exam rooms)

Options for Sharing/Collaboration Identified

There is a long list of potential sharing opportunities in this market—some of them involve small shifts of volume, while other require much more systematic change.

The lists below are recommendations for further assessment—not recommendations for implementation.

Hawaii Market: Summary Level Options for Further Analysis

- Develop closer degree of collaboration, all services and functions
- Consolidate Utilization Management functions between Tripler and VA
- Joint Management Programs – i.e., jointly contract MDs (leverage need)
- Develop joint program in GME
- Open O/P primary and specialty care access between DoD and VA systems (for all CBOC, BMC's, etc.)
- Combine existing Pearl Harbor area centers into a single site (either new or one of the existing)
- Expand long term care capacity and consolidate home care services
- Consolidate lab services
- Provide joint Social Work and Psychiatry
- Expand telemedicine program
- Assess the departments current relationships on the “Relationship Grid” and determine whether there are opportunities to achieve better outcomes through different levels of sharing

Summary of General Collaboration Ideas and Opportunities by Category Drawn from Research and Market Site Visits

Listed below are examples and representations of joint collaboration/sharing ideas (needs, practices, policies, and plans or initiatives) and opportunities in the study markets. Key X=primary driver; O = secondary driver; all categories may be impacted

Opportunity	PT Care	Facilities	Staffing	Bus/Clin Proc	Gov/Mgmt	IM/IT	Logistic	Education	Research
Develop interoperable IM/IT system				O		X			
Coordinate GME training			O		O			X	X
Develop coordinated QM/QI functions				X					
Develop coordinated Utilization Management system				X					
Develop useful balanced scorecard of collaboration relationships				X					
Pursue coordinated offering of primary care	X		O						
Consolidate inpatient (M&S) services at one site	O	X							
Coordinate research programs			O					X	X
Develop comprehensive free standing VA/DoD Ambulatory Care Center (ACC)	O	X							
Consolidate Ancillary Services - Radiology/Imaging	X	O							
Consolidate Ancillary services - laboratory/pathology	X	O							
Coordinate placement of VA CBOCs with DoD	O	X							
Develop uniform approach to managing patient (medical records)				X		O			
Offer single VA/DoD pharmacy formulary				O			X		
Institute joint procurement of medical equipment							X		
Institute joint procurement of supplies							X		
Institute joint procurement of information technology systems (software and hardware)						O	X		
Develop coordinated clinical information systems				O		X			
Integrate Pharmacy services				O			X		
Offer telemedicine services radiology/imaging	X			O					
Offer telemedicine services mental health	X			O					
Offer integrated clinical programs - all specialties	X		O						
Share housekeeping							X		
Share laundry							X		
Share engineering and maintenance							X		
Create common management infrastructure					X				
Develop joint ambulatory surgery program	X	O							
Offer consolidated nutrition care services				O			X		
Share Audiology services	X	O							
Unify VA/DoD mental health services on one site	X	O							
Create joint hospitalist program	X								
Develop coordinated health education and training program			O					X	X
Develop comprehensive and coordinated long term care services and facilities	O	X							
Coordinate recruitment and retention of physicians	O		X						
Coordinate recruitment and retention of technical and professional personnel			X						
Develop shared family practice residency program	O							X	X
Coordinate delivery of joint substance abuse program	X								
Develop medical and surgical specialty residency program	X							X	X
Coordinate panel sizes and productivity standards				X				O	O
Implement common access (time distance waiting) standards	O			X					
Coordinate development of clinical practice guidelines				O				X	X
Develop common protocols for measuring and monitoring clinical outcomes data	X			O					
Consolidate unused space		X							
Create joint planning office					X				
Develop common health promotion and prevention program			X	O					
Develop compressive and coordinated cancer management program	X		O						
Establish uniform and coordinated approach to dealing with community hospitals				O	X				
Coordinate HR policies particularly pay scales			O	X					
Revisit and intensify joint disaster preparedness				X					
Implement joint transportation services							X		
Consolidate emergency room services and facilities	O	X							
Create joint float pools			X						
Develop and coordinate home care programs	X		O						
Jointly investigate new technology				O			X		
Share library resources		O					X		
Share education space		X						O	O
Other									

**Summary of General Collaboration Ideas and Opportunities by Category Drawn
from Research and Market Site Visits**

Hawaii

Listed below are examples and representations of joint collaboration/sharing ideas (needs, practices, policies, and plans or initiatives) and opportunities in the study markets. Key X= Identified opportunity based on interview data base

Opportunity	VAMROC	TAMC
Develop expanded and coordinated substance abuse program for VA & DoD beneficiaries.	X	X
Maximize sharing opportunities at proximal facilities	X	X
Improve inpatient and specialty care in Western Pacific for both VA & DoD - (to address the huge distances that must be traveled for many simple referrals that are now made to Tripler	X	X
Improve IM/IT coordination.	X	X
Expand and share metrics and improve data analysis (eg develop combined balanced scorecard).	X	X
Improve site access to TAMC & VA.	X	X
Develop combined and improved GME program.	X	X
Resolve shortages and access problems for placement of long-term care patients.	X	X
Develop unified billing system.	X	X
Sharing opportunities.	X	X
1. Logistics	X	X
2. Pharmacy	X	X
3. Lab	X	X
4. X-ray	X	X
5. Resource Management	X	X
6. Patient administration	X	X
7. Human Resources	X	X
8. Facility management	X	X
9. Case management.	X	X
10. Laundry/Linen		X
11. Medical Waste	X	X
12. Transport		X
13. Collaborative research	X	X
14. Joint medical credentialing	X	X
15. Social work and psychology	X	X
Address continuity of care matters with particular attention to patients that receive care within community facilities.	X	X
Address outlying clinics as possible feeder to TAMC.		X
Provide all inpatient care for vets at TAMC (e.g., urology go to Kaiser, head and neck patients go to California).		X
Expand Hospitalist Program.	X	X
Develop governance model to bridge both systems	X	X
Develop coordinated public affairs office (PAO).		X
Develop coordinated planning office.	X	X
Coordinate physician recruitment and retention.	X	X
Expand homecare at TAMC	X	

Site Visit Database Summary

Market: Hawaii

Submarket: Oahu

Facility: VAMROC

General Statement: The Veterans Administration Medical and Regional Office Center (VAMROC) serves veterans in the Pacific Basin, a geographic service area of 4.8 million square miles. VAMROC provides outpatient treatment through the Ambulatory Care Center in Oahu co-located on the grounds of TAMC, and through five primary care clinics on the Hawaiian Islands and Guam. The Ambulatory Care Center provides primary care services that include mental health, women’s health, specialty services, radiology and optometry with associated support services. The Pacific Center for Post-Traumatic-Stress-Disorder (PTSD) is operating in Hawaii with unique capabilities for PTSD treatment, research and education. In addition to the Ambulatory Care Service there is a 60 bed Center for Aging (nursing home). The CFA is a free standing nursing facility providing convalescent, end of life care, respite care, rehabilitation, geriatric and geri-psychiatric care to eligible veterans. Inpatient services for veterans are provided through a sharing agreement with TAMC and some community hospitals. A VA locked psychiatric ward at TAMC is jointly staffed by DoD and VA MDs.

Organizational Relationships: Affiliated with Tripler Army medical center (TAMC) . VAMROC is also affiliated with the University of Hawaii for Graduate Medical Education (GME). Other affiliations include nursing, pharmacy, dentistry and other specialties

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
<p>Patient/Clinical Care</p> <p><i>Inpatient</i></p>	<ul style="list-style-type: none"> • Inpatient care provided to veterans at TAMC if space is available; patients are transferred to Palo Alto or to the private sector if beds or specific specialty care is unavailable • CFA provides rehabilitation, long term care, respite care up to 30 days per year, and hospice care. Demand for beds exceeds supply causing back ups and long LOS at TAMC. Lack of long term beds is identified as a major problem island wide 	<ul style="list-style-type: none"> • Review opportunities for referring all inpatients to TAMC except under rare circumstances • Addition of LTC beds to meet demand and decompress inpatient beds at TAMC
<p>Medical/Surgical</p>	<ul style="list-style-type: none"> • VA Hospitalists oversee inpatient medical care for 	<ul style="list-style-type: none"> • Expand hospitalist program to additional

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	both DoD and VA patients. This is a successful sharing initiative	inpatient services
Specialty Care	<ul style="list-style-type: none"> • VA has problems with back up for specialty care when military sub-specialists are deployed. At time of visit there were deficiencies in gastroenterology and nephrology • VA provides back-up for geriatrics to TAMC 	<ul style="list-style-type: none"> • Explore unified DoD/VA program for recruiting and retaining professional staff particularly during times of deployment
Behavioral Health	<ul style="list-style-type: none"> • VA inpatients on a locked unit on the 3rd floor and share staff with TAMC (on 4th floor) • Practice is to keep DoD and VA patients separate due to incompatibility of medical care needs 	<ul style="list-style-type: none"> • Explore potential for comprehensive joint behavioral health program
Extended Care	<ul style="list-style-type: none"> • CFA has insufficient beds to offer long term care and is currently not licensed for this type of care • Lack of long tem care is identified as acute island wide 	<ul style="list-style-type: none"> • Explore potential of adding long term care beds with appropriate licensing.
<i>Outpatient</i>		
Medical Specialties		
Surgical Specialties		
Behavioral Health		
<i>Ancillary Services</i>	Pharmacy <ul style="list-style-type: none"> • There is a CHCS terminal located in the pharmacy • VA provides a mailing service for prescriptions (about 50% of total volume) 	
<i>Management/Governance</i>	<ul style="list-style-type: none"> • Joint planning council was identified as a need • Culture differences need to be considered in determining governance 	<ul style="list-style-type: none"> • Establish joint planning council and establish agreed upon metrics • Development of agreed on governance model

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<p>structure; 3 models described; 1. DoD headed 2. VA headed 3. Executive agent model</p> <ul style="list-style-type: none"> • Need guidance from the top down to determine which initiatives should be used to avoid the appearance a “hit and miss” approach • Can the “cost of readiness” be separated out and the remaining medical requirements all be treated as joint initiatives? 	
<i>Clinical/Business Processes</i>	<ul style="list-style-type: none"> • Problems exist between DoD and VA regarding how claims are handled (billed and paid) • Utilization data is not routinely shared with VAs • VA does not receive any VERA credit for being a TRICARE network provider or CHAMPUS certified provider • TAMC’s system requires an authorization to see a patient and VA needs to issue an authorization before a claim can be made • TRICARE is considered an “entitlement” VA is considered a benefit • VA receives no back transfer of utilization/workload data from TAMC 	<ul style="list-style-type: none"> • Alignment of business and billing procedures • Develop mechanism to interpret workload for both entities. Transfer of critical information needed
<i>Facilities</i>	<ul style="list-style-type: none"> • ACC relatively new and State of the Art • Inpatient units • CFA new and has expansion capability 	
<i>Staffing</i>	<ul style="list-style-type: none"> • DoD and VA share psychiatric staff and an 	

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<p>“on call” coverage system</p>	
<i>Surgery</i>	<ul style="list-style-type: none"> • VAs get surgical care at TAMC providing specialty care is available • First priority is active duty so if a service is at capacity Veterans go either to Palo Alto or to the economy 	
<i>Emergency Services</i>	<ul style="list-style-type: none"> • Veterans utilize the Emergency Department at TAMC 	
<i>IM/IT</i>	<ul style="list-style-type: none"> • Incompatible IM/IS systems prevent sharing of pertinent medical information 	<ul style="list-style-type: none"> • Identified need to develop interoperable information management systems
<i>Logistics</i>	<ul style="list-style-type: none"> • Prime vendor contracts for DoD and VA are separate 	<ul style="list-style-type: none"> • Explore options for sharing prime vendor contracts
<i>Education and Training</i>	<ul style="list-style-type: none"> • VA and TAMC have separate GME programs; VA has affiliations with UH in psychiatry, medicine and geriatrics 	<ul style="list-style-type: none"> • Potential for shared, integrated GMR program with DoD and VA
<i>Research</i>	<ul style="list-style-type: none"> • Plans have been discussed for a major bio-medical research building, however funding on the VA side is questionable • There is willingness on both sides to establish a joint sharing venture but regulations and policies prevent full integration • Staffing, especially roles for “principal investigator” are different for DoD and VA. DoD must consider length of assignment of medical staff and potential for deployment when assigning these roles 	<ul style="list-style-type: none"> • Resolve funding, policy and regulatory issues to develop a fully integrated research agenda • Develop guidelines for “principal investigators”

DoD/VA Joint Assessment Study

Site Visit Database Summary

Market: Hawaii

Submarket:

Facility: Tripler Army Medical Center

Interview Summary

General Statement: Tripler Army Medical Center is a major teaching hospital that provides tertiary care as well as ambulatory care to active-duty service members of all branches of service, their eligible family members, retirees and their families, veterans and many Pacific Island Nation residents. TAMC is a major teaching facility providing GME in general surgery, otolaryngology, orthopedic surgery, psychiatry, OB/GYN, radiology, pathology oral surgery. In addition there are programs for hospital administration and nurse anesthesia. There is a Telehealth and Technology HUI that oversees a variety of telehealth projects. TAMC facilitates bringing together the military, academic institutions and relief organizations through research, education and training.

Organizational Relationships: TRICARE Pacific is responsible for Hawaii and the western Pacific (excluding Alaska) to include Japan, Okinawa, Guam, Philippines, Singapore and points west.

TAMC operates the US Army Health Clinic at Schofield Barrack, which provides health care to active duty soldiers assigned to the 25th Infantry Division and their families and some local military retirees.

TAMC and the Department of Veteran Affairs Medical Regional Office Center (VAMROC) work closely together on a variety of joint venture projects. In May, 2000 VAMROC co-located with TAMC and opened the Spark M. Matsunaga VA Ambulatory Care Clinic.

TAMC is affiliated with the University of Hawaii for GME

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
<p>Patient/Clinical Care <i>Inpatient</i></p>	<ul style="list-style-type: none"> • Utilization management is separate for both entities (DoD and VA) resulting in inefficient patient flow • Active duty patients have first priority for access to services (mission driven) • Some veterans are diverted due to a lack of capacity at TAMC • Inpatient bed need is 	<ul style="list-style-type: none"> • Integration of utilization management function • Combine and expand discharge planning for all

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<p>increasing; increased capacity will be necessary to provide care to all beneficiaries</p> <ul style="list-style-type: none"> • Case managers and discharge planning are not extended to the entire VA population • “Care Homes” in the state have lost Medicare funding thereby eliminating one option for post-hospital treatment • Several inpatient floors have been “decommissioned” to serve as offices and administrative space • No automated medication dispensing systems 	<p>patients</p> <ul style="list-style-type: none"> • Administrative space could be converted to patient care space if needed. • Identify alternative space for administrative functions
<p>Medical/Surgical</p>	<ul style="list-style-type: none"> • Inpatient beds at capacity; additional beds would require refitting of clinical space currently used for administrative space • At times elective surgery is cancelled or ED goes on diversion with lack of beds • Referrals to the private sector occur when specialists are not available for all beneficiaries • Hospitalists cover for DoD and VA patients on the medical service improving throughput 	<ul style="list-style-type: none"> • Bed need analysis for all inpatient services • Opportunity to save space by combining administrative functions • Successful model could be expanded to all services
<p>Specialty Care</p>	<ul style="list-style-type: none"> • Orthopedic care for active duty is a problem due to backlog and availability of orthopedists • Availability of specialists in key areas impacts services sporadically; In March 2003 Neurosurgery was closed to VA patients. When specialists are not available patients go to the 	<ul style="list-style-type: none"> • Conduct joint DoD/VA review of recruitment and retention requirements

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
Behavioral Health	<p>economy</p> <ul style="list-style-type: none"> • Joint programs with VA • RNs staff permanently assigned to each unit; MDs "float" between units • Reluctance to mix military and AD patients due to differences in goals of treatment and kind of care needed. DoD shorter LOS younger with psycho-social issues VA older with more chronic issues. Patients are said to get into fights (units had been previously combined) • DoD LOS 4-5 days; VA 9-10 days due to different financial incentives • 4th floor (DoD unit) locked or unlocked depending on patient population • Separate outpatient programs for DoD and VA • Difficulty finding long term care beds for mental health patients 	<ul style="list-style-type: none"> • Potential to design comprehensive combined behavioral health programs • Have DoD and VA MDs see both DoD and VA patients in order to improve the exposure and experience for both groups
Extended Care	<ul style="list-style-type: none"> • Lack of Long Term care beds for existing population causing longer LOS for those awaiting placement (limited availability of meds in CFA) and back-up in critical care areas 	<ul style="list-style-type: none"> • Conduct comprehensive bed need analysis for anticipated future volumes including need for long term care beds needed for VA and retirees
<i>Surgery</i>	<ul style="list-style-type: none"> • 12 OR suites- 10 currently in use; 5645 cases reported for FY02 • Users express need for additional ORs • Cardiac surgery cases @ 134/yr at TAMC; 3 cardiac surgeons also do cases at civilian hospitals in order to meet GME requirements • Current GI space is inadequate and demand is 	<ul style="list-style-type: none"> • Capacity exists for additional surgery • Potential to combine cardiac surgery with another program to achieve efficiency • Increase capacity, add procedure and support space in GI and add hours of operations • Maintain desired amounts and types of sub-

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	increasing. 100 VA patients sent out monthly <ul style="list-style-type: none"> • Some surgical sub-specialists are not available or in short supply causing cases to be transferred to the economy • Average case length reported at 3.9 hours is considerably above the private sector averages • OR utilization reported at 90% • VA accounts for 5% of surgical case volume 	specialists; use VA's ability to employ MDs to balance cyclical nature of DoD supply <ul style="list-style-type: none"> • Review practices to identify opportunities to reduce case length and improve turnaround time
<i>Emergency Department</i>	<ul style="list-style-type: none"> • VA patients prefer to come to Tripler – resulting in overcrowding of ED • There is no way to verify eligibility after hours • DoD uses paper chart; VA must be put into system and access to medical records is difficult • Insufficient treatment space for demand • Inadequate social service coverage 	<ul style="list-style-type: none"> • See IM/IT section • Evaluate sources of ED demand: how much could be seen in scheduled clinics
<i>Outpatient</i>	<ul style="list-style-type: none"> • Provider capacity could be increased 	
Medical Specialties	<ul style="list-style-type: none"> • More resources (providers and capital) are needed to meet growing demand 	
Surgical Specialties	<ul style="list-style-type: none"> • There is a reported shortage of Gastroenterologists and dermatologists 	<ul style="list-style-type: none"> • Explore potential for recruitment and coverage by VA MDs
Behavioral Health	<ul style="list-style-type: none"> • TAMC sends MDs to VA outpatient for GME • Joint planning with VA as well as ECT, and combined treatment plans • OP medications must be picked up by VA. Different standards and procedures cause confusion with 	<ul style="list-style-type: none"> • Standardize pharmacy policies and procedures

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	Veterans sometimes using both systems	
<i>Ancillary Services</i>	<p>Radiology</p> <ul style="list-style-type: none"> • reported need for PET scanner; space identified as lacking and funding currently not available • Information system (PACS) is incompatible with VA system (VISTA) Palo Alto (VA tertiary facility) cannot access and films must be sent • Women's' Center planning in progress • Well-equipped service provides a high proportion of studies for VA (VA has 1 general unit and 1 radiologist to read films);All other services provided by TAMC staff • Tele-radiology service is comprehensive , however, no link to Palo Alto)VA tertiary facility • IM/IT disparities prevent full integration • VA desires to maintain some independent capabilities • Approvals from both DoD and VA are barriers to sharing • Cost of converting to one system and how to fund is an issue • Space described as limited. Describe need for 2nd MRI unit <p>Pharmacy</p> <ul style="list-style-type: none"> • VA refills are not authorized for DoD • Differences in practice- DoD gives 90 day supply; VA gives 30 day supply • Disparate policies and 	<ul style="list-style-type: none"> • Evaluate need for additional diagnostic technology • Standardize Radiology information system to PACS • Coordinate UR/UM to assist with VA approvals for ancillary and other care • Full integration of radiology services with resolution of IT interoperability issues • Space plan evaluation • Develop comprehensive integrated pharmacy system with aligned policies and procedures and determine cost structure • Joint contracting for purchasing with one formulary • Explore feasibility of joint

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<p>procedures as to what prescriptions can be filled, when and by whom creates confusion within the system and for patients who “game the system”</p> <ul style="list-style-type: none"> • Technology difference for stocking and dispensing between the 2 entities • Separate procurement and contracting for both entities • No mail order pharmacy done on site; TAMC pays TMOP thus mail order not encouraged • Other support services such as infection control, occupational health, separate services and departments are maintained with different standards <p>Clinical Support Department</p> <ul style="list-style-type: none"> • Handles some administrative functions in a centralized manner including scheduling, budget, HQ contracts, standards, policies, data analysis and customer satisfaction <p>Social Services</p> <ul style="list-style-type: none"> • TAMC social workers report to the department while VA social worker reports to the service line <p>Rehabilitation Services</p> <ul style="list-style-type: none"> • Share space only with VA 3 days/week for specified times (VA therapist) • More rehab providers are needed to meet demands • No programs for neuro or stroke patients or spinal cord injury. Veterans get care at civilian facility or sent to Palo Alto 	<p>mail order system</p> <ul style="list-style-type: none"> • Consolidation / integration of services with uniform standards • Review structure and function to determine if some functions could be decentralized to departments with crossover to VA • Potential for one combined social services program with standardization of policies and procedures and determination of funding mechanism • Determine feasibility of additional services and space in rehab
<i>Management/Governance</i>	<ul style="list-style-type: none"> • There is a lack of clear 	<ul style="list-style-type: none"> • Explore governance

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<p>guidelines for integration</p> <ul style="list-style-type: none"> • Governance structure for sharing – a major issue- everyone has a different view of what the governance model should be structured • There is no defined/established organizational structure to assign responsibility for decision making. This is ad hoc. • The “Balanced Scorecard” is a good tool but few are expert at it’s application • Public affairs officer at TAMC ;Currently there is an “acting PAO at VA. TAMC believes the position is successful to a joint venture while VA does not share this perspective. Also TAMC would provide this service and expect funding from VAMC to provide this service. Activities are not coordinated and communicated 	<p>models and facilitate a process to determine an effective governance structure</p> <ul style="list-style-type: none"> • Assess political support to create a Federal Health Care System named the “Tripler-Matsunaga Federal Medical System” • Increase implementation of Balanced Scorecard in other areas
<p><i>Clinical/Business Processes</i></p>	<ul style="list-style-type: none"> • Business aspects are not fully integrated between TAMC and VA. Cultures are different. • The cost of operations and the allocation of costs for each service or episode of care is not clearly defined and each entity wants to pass the cost on to the other • No integrated billing systems • Payments for beneficiaries from VA is disputed • There is little sharing/collaboration in administrative, logistical 	<ul style="list-style-type: none"> • Cooperative decision making along with the willingness to change promote integration activities • Determine if a joint pool for designated services or equipment is feasible • Agreements that result in the lowest cost/better quality option

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<p>and clinical support (medical records, procurement, warehousing)</p> <ul style="list-style-type: none"> • There are no clear financial incentive for staying within the DoD/VA system 	<ul style="list-style-type: none"> • Potential to explore an integrated solution
<i>Facilities</i>	<ul style="list-style-type: none"> • TAMC occupies a circa 1950 building that has a large deferred maintenance backlog; the diagnostic services are housed predominantly in 1985 expansion wings • Renovation of existing space often produces inefficient results due to existing constraints • The existing site along with the internal organization of TAMC poses challenging pedestrian and parking access issues • Barriers to access are due in part to the huge distances in the Pacific to reach a treatment facility • Difficulty in integrating care on neighboring island with DoD for VA patients where there is the perception that access to care for veterans in an integrated network would be diminished • During heightened security alerts, access to both VAMROC and TAMC is reduced due to their co-location 	<ul style="list-style-type: none"> • Separate administrative office to be established in Okinawa for Westpac. (This TAMC based office will be responsible for HI) • VAMROC has an excellent new ambulatory services building with an adjacent parking garage • VAMROC and TAMC are physically co-located and the potential exists to share most/all facility and equipment assets • Continue to conduct joint master facility planning studies
<i>Staffing</i>	<ul style="list-style-type: none"> • Staffing shortages noted for nurses and social services • Potential to add more beds with the addition of nursing staff • Disparity in salaries 	<ul style="list-style-type: none"> • Expand joint recruitment and retention and combine efforts • Resolve pay-scale inequities

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	between military, VA and GC nursing staff	
<i>IM/IT</i>	<ul style="list-style-type: none"> • IM/IT systems are not compatible and prevent effective flow of communication between entities. (database integration under development • Systems need to be more metrics driven to be efficient • IT systems for lab; TAMC uses CHCS; VA enters data manually into VISTA; Interoperability of the systems prevents the consolidation of services • The HUI is a group that has been working on integrating the systems; sometimes builds tools that then require support • The Operating Room has a home grown information system for scheduling and some reporting 	<ul style="list-style-type: none"> • Evaluate potential of full integrated IM/IT at all levels • Evaluate need for comprehensive OR Management system with appropriate interfaces
<i>Logistics</i>	<ul style="list-style-type: none"> • There is no centralized agreement or policy for procurement of major capital equipment due to established Prime Vendor provider agreements. • Medical procurement cannot be integrated at this time due to Medcom SOP • Procurement for medical supplies is allocated to several different individuals 	<ul style="list-style-type: none"> • Joint contracting initiative to reduce costs
<i>Education and Training</i>	<ul style="list-style-type: none"> • Diversion of veterans for inpatient care due to lack of capacity negatively impacts the GME program • Residents from the GME program go to Queens Hospital; medical students 	<ul style="list-style-type: none"> • Joint programs for all entities ; Teaching programs are enhanced with VA mix • Develop collaborative continuity with VA MDs to plan for unexpected

Collaboration Category	Key Functional Characteristics/ Barriers to Sharing	Opportunities
	<p>from University of Hawaii come to TAMC</p> <ul style="list-style-type: none"> • There are some joint educational offerings between TAMC and VA but many are still separate • Military mission of readiness presents complications when deployment is requires especially when sub-specialty is impacted and decreased by deployment • Credentialing processes are separate for DoD and VA 	<p>vacancies caused by deployment</p> <ul style="list-style-type: none"> • Establish joint credentialing process through procedure development
<p><i>Research</i></p>	<ul style="list-style-type: none"> • Clinical Investigation projects- 200 as of Sept 02 • There is potential to pursue a new joint research building but current issues, policies and procedures prevent full integration. These include confidentiality, medical records requirements, and method of selecting patients for studies, • Programs are not currently integrated with VA due to policies and regulations for “principal Investigators” • Length of assignment for Military MDs is a factor • Limited pool of “subjects” may have an impact in certain studies • Funding for research from 2 different entities is in question. Both organizations have issues with who pays for the facility and on going support • Currently there is a desire for collaboration if barriers can be overcome 	<p>Obstacles to overcome include</p> <ol style="list-style-type: none"> 1. need to establish 1 IRB with accountability and infrastructure redefined 2. develop uniform set of regulations, policies and procedures 3. determine source of funding for each 4. Agreement on need for an accreditation process 5. defined accountability for PI and associates <ul style="list-style-type: none"> • Establish policies and procedures for joint clinical program especially assignment of PI role to establish comprehensive, coordinated and collaborative research agenda • Negotiate joint research and clinical trials collaboration with defined infrastructure

Functional Assessment Red/Amber/Green Definitions

	Size
G	Area within + 10% of programmed area
A	Area is > + 10% of Prog. Area
R	Area is < ± 10% of Prog. Area (GSF), and rooms have specific requirements which are difficult/expensive to repair
	Configuration
G	Configuration appropriate to accomplish mission
A	Not good, but could be easily altered in place
R	Not Configured To do Mission – ex. Department split, patient floor, inappropriate room size
	Location
G	Department located appropriately in building for efficiency and ease of staff and patients
A	Location is not an issue for efficiency and convenience for staff and patients
R	Department location is inconvenient in the building and causes inefficiency for staff and patients
	Adjacency
G	Adjacent to appropriate departments for operational or patient ease/efficiency or can stand independent of other departments
A	Would like certain adjacency but function OK
R	Needs to be located near another department
	Interior – Image
G	Appropriate and up to date
A	Appropriate but appears dated
R	Inappropriate for use
	Interior Condition
G	In excellent condition
A	In fair condition
R	Needs replacement
	ADA Compliance
G	Meets ADA requirements for area and access
A	ADA requirements met through adaptation of space and systems where possible
R	Does not meet ADA requirements

Key: G=Green, A=Amber, R=Red

DoDVA Joint Assessment Study
Building Condition Assessments

Hawaii Market Area

Below is information gathered by the engineers on the project team. Building Infrastructure Condition is on a Poor, Fair, Good, Very Good, Excellent subjective scale derived from quick tours of the buildings. Only the major clinical buildings were reviewed. FCI (facility condition index), Plant Replacement Value, and Deferred Maintenance was entered only if provided by the sites. The information contained in the database is not interchangeable with the level of detail that would be derived from a Facilities Master Plan and/or a Facilities Condition Assessment.

FACILITYNAME	BLDG_NAME	BUILDINGID	BLDG_NUM	AGE	BGSF	BNSF	YEAR_BUILT	FCI	REPLACE_VALUE	DEFER_MAINT	CONDITION

Hawaii Market Area

Supply Counts from Site Visits and Surveys

Below are the supply counts and characteristics provided by the sites either in response to a survey or via site visits. DoD sites are in capital letters to help quickly differentiate DoD from VA. Note that "Exam Rooms" cannot be added to derive the total number of exam rooms in a market, since some exam rooms are duplicated between multiple clinics (e.g. if cardiology has 5 exam rooms half of the week and endocrinology has the same 5 exam rooms half of the week, they each are assigned 5 exam rooms)

1.0 INTRODUCTION

This document describes Mitretek Systems' methodology for identifying sharing opportunities in a health care services market area that is jointly served by the health care delivery system resources of the Departments of Defense (DoD) and Veterans Affairs (VA). Over the last 20 years, DoD and VA have actively partnered in a variety of resource sharing activities, and the two systems continue to pursue and capitalize on joint venture opportunities wherein the efforts and outcomes would prove to be of mutual benefit.

Section 8147 of the FY 2002 Defense Appropriations Act required the Secretaries of Defense and Veterans Affairs to jointly conduct a comprehensive assessment that identifies and evaluates changes to DoD and VA health care delivery policies, methods, practices and procedures, in order to provide improved health care services at reduced costs to the taxpayer. To implement the Congressional study mandate, the Office of Special Programs, TRICARE Management Activity, contracted with Mitretek Systems (MTS) to conduct demonstration projects in three DoD/VA market areas: Puget Sound, Hawaii, and the Gulf Coast areas of western Florida, Alabama, and southern Mississippi.

A primary objective of this DoD/VA Joint Assessment Study was to develop a replicable study methodology and a standard data repository to support the study objectives at both the demonstration sites and in future applications in other markets nationally. The intent of this document is to explain the approach used to develop the replicable methodology, describe the data repository, document the methodology's key components and tasks, and identify methodology implementation requirements.

This page intentionally left blank

2.0 OVERVIEW AND APPROACH

To develop a methodology designed to be repeated and applied to different market areas where DoD and VA provide health care services, the MTS project team focused on a key question such a methodology should be designed to address:

What is the best approach (or combination of approaches) for organizing the system resources of the DoD and VA to deliver timely, accessible, effective, efficient, and high quality health care to meet the needs of eligible beneficiaries in the market?

Based on team discussion and consultations with TMA and VA representatives, the MTS project team formulated *several principles* for guiding the development of the replicable methodology. These are:

- DoD and VA need a study methodology that will withstand external scrutiny.
- Prior and current delivery system realignment efforts (e.g., VA CARES, Joint Venture sites, President's Task Force) are useful starting points, but should not be constraining.
- Conclusions should be tied to and supported by data—i.e., “call it by the numbers”.
- Best practices/methods should be used to address the key question.

With these guiding principles in mind, the MTS project team shaped specific design objectives for the methodology. When completed, the methodology had to contain data, techniques, and methods that would collectively:

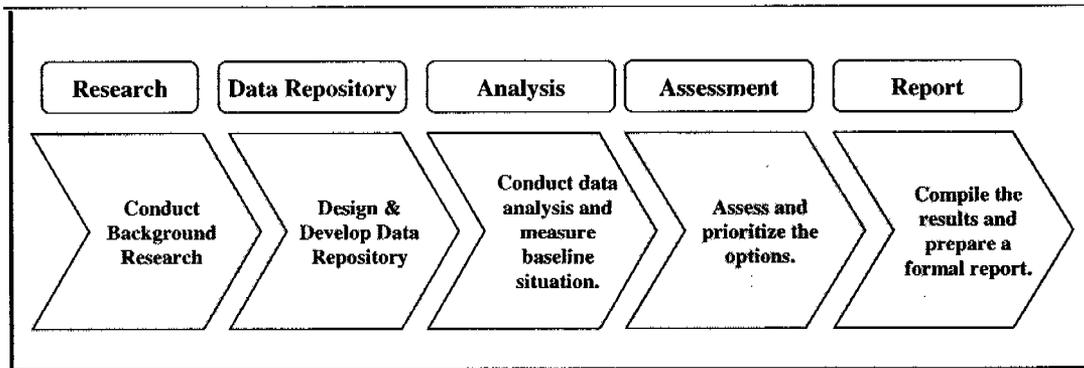

- Measure current levels of utilization from the populations served
- Document current DoD and VA capacities and current annual costs incurred for providing these services
- Project future demand on the DoD/VA system based on expected changes in future service populations and other factors
- Identify gaps and imbalances between service demand and service capacity that might exist now and in the future
- Define those sharing and integration alternatives that could improve future system performance based upon expected improvements in service or reduced costs compared to continuing the status quo operations

To meet the objectives listed above, the study team developed a methodology and refined each of its components during and after its application to the three study market areas. The major steps in its development included:

1. Development of a population-based demand analysis methodology
2. Development of an integrated data model that would account for and accommodate the lack of common data available from the Departments on current operations
3. Capturing required data in an enterprise-level database
4. Developing tools, methods, and techniques required to support the analysis
5. Executing the methodology in each study market area
6. Refining the methodology iteratively following each execution
7. Producing a methodology description that is applicable on national scale

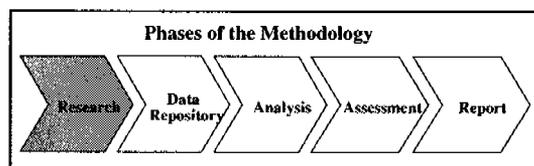

The methodology described in this document provides a useful framework for guiding future studies of other DoD/VA market areas. The methodology is categorized into five key Phases, as shown in the exhibit below. The remainder of this document provides an overview of each Phase.

Figure 1: Phases of the DoD/VA JAS Methodology

3.0 PHASES OF THE METHODOLOGY

3.1 Research

The qualitative elements of the assignment involved the pursuit of a research agenda which called for review of a broad array of documentation on the subject of DoD/VA sharing and collaboration. Also, it required extensive interviewing with individuals who have knowledge of and experience in dealing with the dynamics of sharing.

The first Phase of the Methodology is research, which is needed to develop a thorough understanding and appreciation of the issues surrounding DoD/VA sharing. To apply this methodology, the key research objectives are as follows:

- To understand the context of DoD/VA organizational relationships;
- To serve as input into the study design and other Phases of the methodology;
- To understand substantive matters: key elements, issues, barriers, and ingredients for successful collaboration.

The major focus of the background research is to identify and understand market-specific history and current plans for joint ventures and sharing initiatives between DoD and VA. This information provides insight into market areas and helps to identify target areas for potential sharing opportunities. Pertinent studies, reports, analyses, proposals or initiatives associated with the Study market areas are researched and analyzed to identify current or planned initiatives as well as to help clarify and/or validate the relevant market area definitions. The subsections below characterize how the research was conducted for the initial application of this methodology in the Joint Assessment Study.

Research Conducted for Initial Application of Methodology

Conducting the background research involved collecting and reviewing previously prepared documentation pertaining to the broad subject of DoD/VA sharing and collaboration. Mitretek team members reviewed a wide spectrum of reports, studies, websites, briefings and presentation materials. Information sources came from many government agencies including the Department of Defense and its component services, the Department of Veterans Affairs, the Department of Health and Human Services (DHHS), Congressional committees and testimony, General Accounting Office (GAO), Office of Management and Budget (OMB), and the Congressional Budget Office (CBO). Additionally, reference was made to non-government documentation relating to the planning of large health delivery systems.

The initial Joint Assessment Study drew from a wide variety of sources including, but not limited to, the following:

- Special Commissions (i.e., The President’s Task Force to Improve Health Care for our Nation’s Veterans)
- CARES Initiatives
- TRICARE Initiatives
- GAO Reports
- Special Congressional Investigations
- Salient findings from field investigations of various joint venture sites

Information sources came from many government agencies including the Department of Defense and its component services, the Veterans Administration, Department of Health and Human Services (DHHS), Congressional committees and testimony, General Accounting Office (GAO), Office of Management and Budget (OMB), Congressional Budget Office (CBO). Additionally reference was also made to non government documentation relating to planning of large health delivery systems. See Attachment 1 for a listing of key reference documents that were reviewed for the initial Study.

Reviewing and Assimilating Key Information to Inform the Analysis

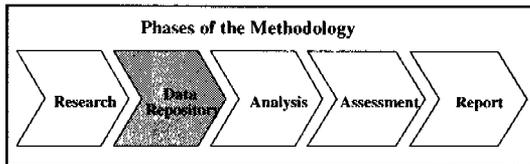

The research effort also involves personal contact with organizations and interviews with individuals who have knowledge about or interest in the history and development of DoD/VA sharing and collaboration activities. Input is sought from participants involved in other DoD/VA joint venture sites around the country, and individuals from other government and non-government agencies affected by DoD/VA planning and collaboration. See Attachment 2 for a full listing of the individuals and representative organizations who were interviewed about DoD/VA sharing for the initial application of this methodology during the Joint Assessment Study.

Research also included a series of meetings with representatives at current Joint Venture sites to investigate what is working well and what barriers the staff, leaders, and others have encountered in their sharing efforts:

- Sacramento and Fairfield, CA
 - David Grant Medical Center, (Travis AFB) *and*
 - VA Northern California Health Care System.
- Albuquerque, NM
 - Kirtland AFB Clinic *and*
 - Albuquerque VAMC
- Las Vegas, NV
 - Mike O’Callaghan Federal Hospital, (Nellis AFB) *and*
 - VA Southern Nevada Health Care System.

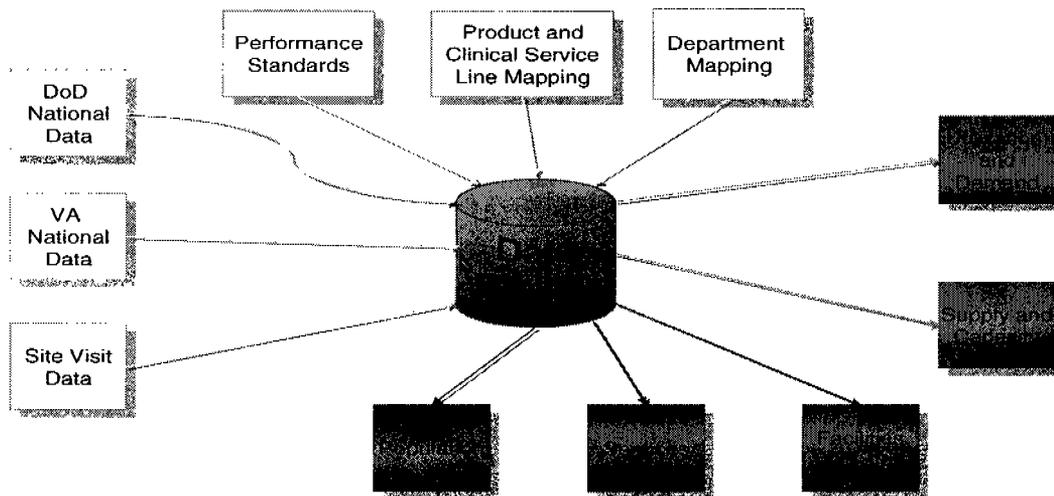

The research effort will naturally vary in terms of depth and time required depending on the market being analyzed and the magnitude of the problems or issues. For example, an analysis of a specific set of sharing opportunities at a regional/local level may only require limited review of relevant material for background purposes with particular focus on “primary research,” – i.e., interviews/meetings with informed individuals who could help frame the issues for analysis.

3.2 Data Repository

This Phase of the methodology, which is highly technical in nature, is *the* foundation to executing the Analysis and Assessment Phases. This section describes, in general terms, how the data obtained from the national DoD and VA sources are organized and integrated to accomplish the objectives of the methodology. A significant challenge that this Phase of the methodology addresses is the integration of data from two very different health care delivery Systems, with disparate file structures, data sources, and data formats, and in some cases, unique data with sometimes contradictory meanings. The following diagram provides a general sense of how the source data (left side) and reference data (i.e., data maps) are captured in the data repository to generate the data outputs necessary to support the analysis.

Data Integration

Data Collection

Source data that are gathered from the DoD and VA national sources are organized into a single, multi-file data repository and integrated through data mapping tools so that the output data provides comparable and consistent measures of population, demand, supply, access, and cost, for DoD and VA services and facilities within the study market area.

The table below lists some of the key data sources required to support this methodology. These data sets and the specific levels at which the data are captured are essential

elements—in terms of the range of variables and depth or degree of detail—to execute the Analysis and Assessment Phases of the methodology.

Data Source	Data Source Name	System	Key Elements
PITE	Point In Time Extract file	DoD	Counts and demographic description of Eligible beneficiaries
VetPop	Veteran Population	VA	
LENR	Longitudinal Enrollment Record	DoD	Counts and demographic description of Enrolled beneficiaries
EMF	Enrollment Master File	VA	
SIDR	Standard Inpatient Data Record	DoD	Patient record level activity providing counts of users, and procedural detail for direct care services from Federal health care providers
SADR	Standard Ambulatory Data Record	DoD	
PTF	Patient Treatment File	VA	
OPC	Outpatient Care File	VA	
HCSR-I, and HCSR-NI	Health Care Services Record, Institutional and Non-institutional files	DoD	
PTF and OPC Fee-	Patient Treatment File and Outpatient Care Fee-basis files	VA	Claims activity establishing counts of users, with procedural detail for indirect care services received from non-federal providers, both facilities (HCSR-I and PTF fee) and clinicians (HCSR-NI an OPC fee)
MEPRS	Medical Expense Performance and Reporting System	DoD	Cost data reports for facilities and health care systems
ALBCC	Account Level Budget Cost Center cost reports	VA	

To implement this methodology, the data request requires data in both a current year and base year time horizon. All person-level records of health care utilization for eligible persons residing in each county and ZIP code of the market area are requested, regardless of where these beneficiaries obtained care. All person-level records of health care utilization, regardless of patient origin, for VA providers, DoD providers, and other non-federal providers paid by DoD and/or VA to provide health care services for their beneficiary populations within the market areas are requested.

The government and the contractor need to agree upon the data transfer. Data requests developed for the initial application of this methodology should be used as the foundation for future requests. The data specifications for the Joint Assessment Study are provided as Attachment 7 of this Appendix. That attachment provides a technical description of how the data are imported into the data repository, as well as the processes, interface programs, and tools utilized to prepare the data for subsequent analysis.

Data Repository Design

In addition to providing information that drives data analysis, the data repository itself is a key component of the methodology, as it organizes diverse DoD and VA data into a coherent and integrated whole, identifying and defining the essential information needed to support effective and timely decision-making on sharing and collaboration opportunities between DoD and VA. The challenge of designing an effective data repository is to develop methods to efficiently collect these large volumes of disparate data, integrate and organize the data physically, and apply conceptually effective frameworks to retrieve and present the data to address questions about the population,

workload and facilities from both Systems in a timely manner. In the initial application of the methodology, the components of the data repository included:

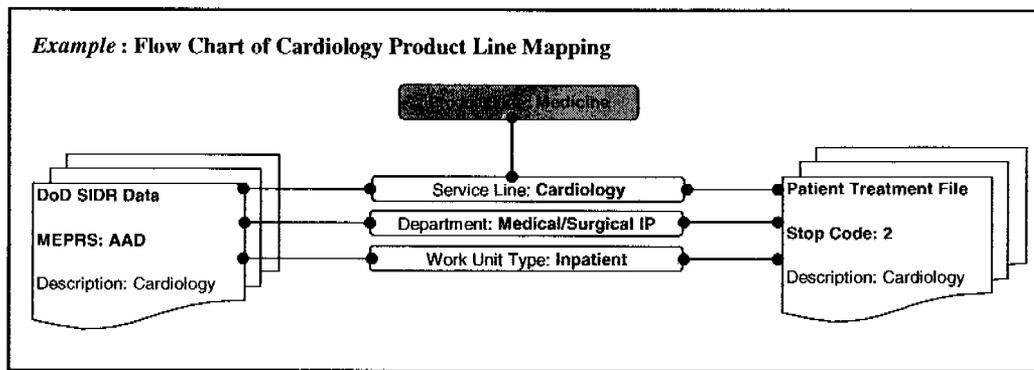

- an entity relationship diagram (ERD);
- a common data dictionary;
- mapping of DoD and VA data to common database elements;
- a physical database schema; and,
- data tables or decision support tools to support the Analysis and Assessment tasks.

Data Modeling

In data modeling, the data are categorized into broad categories (e.g., demographic information about the population, workload volumes and costs, facility descriptive elements, staff related elements, etc.). These broad categories are further analyzed to identify *entities*. (If data modeling had a grammar with parts of speech, entities would be the nouns). Examples of entities include patients, facilities, providers, etc. Data modeling then establishes relationships among entities to describe the extent to which they interact, or the degrees of their dependence or interdependence. For example, Patient A received care at Facility B from Provider C. These conceptual relationships are documented and displayed using an Entity-Relationship Diagram (ERD).

Once the conceptual relationship among the entities is established, data modeling identifies *attributes* that describe the entities in more detail. (Attributes are the adjectives) For example, Mitretek established the attributes of age, gender, beneficiary group, and location of residence to apply to the entity of “person.” Data modeling establishes and identifies relevant attributes which are both necessary and sufficient to include in the data repository. Some attributes (e.g., height) are not relevant; others (e.g., patient classification based on previous use of either System) may be relevant, but not available in the data obtained.

The entities and their attributes are then organized into data tables to reduce redundancy and improve efficiency, and the corresponding relationships among them are established. This process is called normalization. Below is the physical layout of the data repository developed for the initial application of this methodology.

A department mapping was also created, as part of this methodology, to group site-specific data into a standard set of operational departments. These departments group the DoD's MEPRS codes and the VA's Bed Station and Clinic Stop codes into common resource categories to provide a single, integrated description of the site supply data. In this way, the supply data from each facility or site can be compared to and analyzed with the national demand data across the DoD and VA. This mapping also furnishes an audit trail that provides a view back from the "joint" product and clinical service lines defined for the methodology to the DoD's MEPRS codes and the VA's Bed Station and Clinic Stop codes. The Product/Service Line (PSL) crosswalk developed for the initial application of this methodology is provided as an attachment to this appendix.

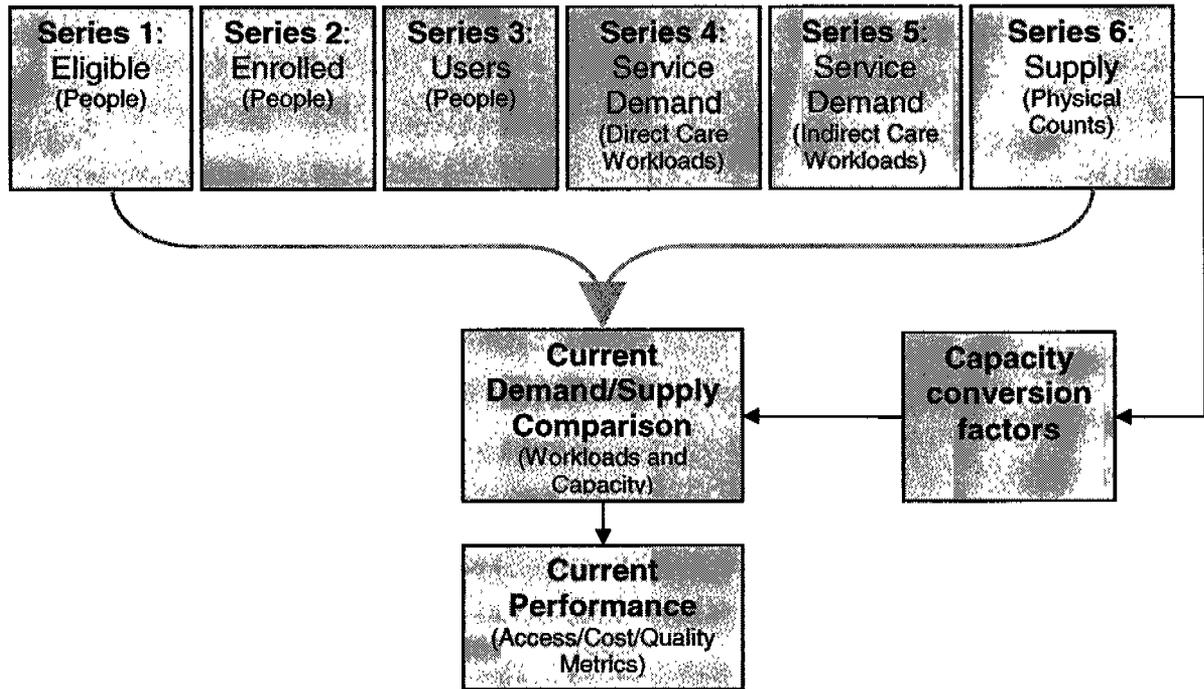

The product and clinical service line mappings—along with the department mapping—translate the DoD and VA national data and the site visit data in the data repository into the information required to complete the population, services, and facilities and staff components in the analysis Phase of the methodology.

Data Loading

After the data mapping is complete, data types and indexes are defined so that the data from each System can be loaded into the Data Repository in Oracle. The appropriate procedures/insert queries are written to transfer the different data formats to the data repository and conduct any transformations needed in the process. A lengthy period of quality control must follow, to insure the transfer is completed successfully and that the data in the repository is correctly organized, loaded, and ready for analysis.

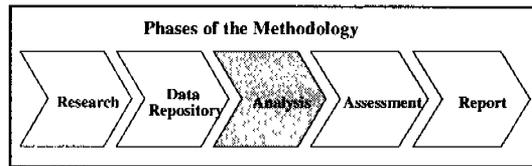

Preparation for the Analysis

The data for each study market are exported into a Decision Support Tool, which is comprised of several sets of Microsoft Excel Pivot Tables (a pivot table is a function of MS Excel). This tool permits flexible manipulation of large datasets by enabling the user to specify various groupings and filters of attributes on the entities contained in the data repository. The analyst can organize the Decision Support Tools into several "series," each containing data about a specific entity (e.g., eligible beneficiaries) with a variety of attributes (e.g., age, gender, beneficiary group, location of residence). A series of analytical data tables from the initial application of this methodology are illustrated in the figure below.

The data was channeled into these “Series” to establish a flexible analytical tool in a user-friendly environment. The Series were created in Microsoft Pivot Tables with a set of standard “tables” to display a set of preliminary combinations of outputs at a specific level. A full description of these Series can be found in *Attachment 7 - Decision Support Tool Technical Documentation*.

3.3 Analysis

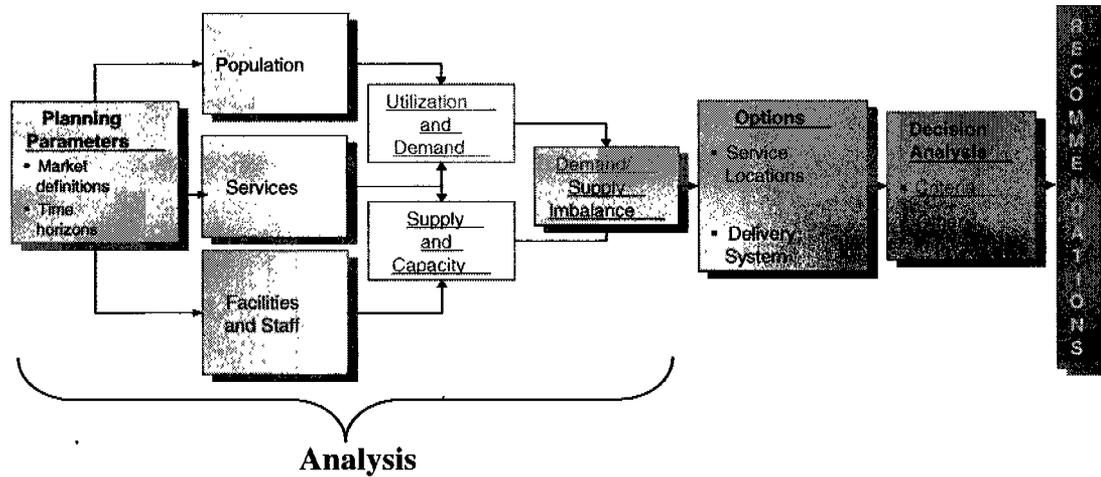

This section describes and documents the analytic steps of the methodology used to transform the background information obtained (Research Phase), and data collected from the national datasets (Data Repository Phase) into market-specific results that inform the identification and assessment of sharing opportunities. This section provides the fundamentals of analysis as it pertains to DoD and VA markets, while using the initial application of the methodology as an example to illustrate the process and key components.

The objective of the Analysis Phase is to describe the current health care system performance in each Market area, including current populations of eligible and enrolled beneficiaries and users; the volume of health care services workload generated by these users; the capacity of the DoD and VA health care facilities to provide these services; and the current performance of the Market measured by access to services and the costs of providing these services. The Analysis Phase produces a baseline description of people, service demand and workload, supply and capacity, and access and cost performance, for each Market and Submarket in the Study. The baseline analysis is the key input to the Assessment Phase, which identifies and assesses options for addressing imbalances between demand and supply, and potential circumstances and situations where greater collaboration, sharing or integration of DoD and VA programs and services would have a mutually beneficial impact.

The flow chart below displays key components of the Analysis Phase and how it leads to the Assessment of the options. The subsections below describe those six components of the process conducted during the Analysis Phase.

Key Components of Analysis and Assessment

Planning Parameters

The Analysis Phase first establishes two key planning parameters: the geographic space or spaces that should be the focus of the study, and the time periods and future planning horizon that the study should encompass. These parameters are needed to define and bound the scope and analytic requirements of the Analysis effort.

Defining Markets and Submarkets

Defining a Market as a bounded geographic area, at a ZIP code and county level, is used to focus the Analysis Phase. DoD and VA define their “market areas” differently. VA specifies geographically delimited, non-overlapping areas—typically encompassing existing political subdivisions such as counties—within a larger Veterans Integrated Service Network (VISN). Also, these markets are typically “anchored” by one or more VA Medical Centers (VAMC). DoD uses a “catchment area” concept. The outer boundaries of a catchment area are defined by a set distance from a Military Treatment Facility (MTF), typically 40 miles for a hospital, and 20 miles for an outpatient center.

In defining the market areas, the initial application of this methodology used the union of the existing DoD and VA market definitions as much as possible, and defined a *Market area* as the smallest geographically delimited area that encompasses both the VA VISN Market (and submarkets where defined) and the catchment areas of the DoD MTFs located in this VA VISN market.

For the initial Joint Assessment Study, applying this logic resulted in the following market area definitions:

- Puget Sound: 16 counties in western Washington, consistent with the VA CARES “Western Washington” submarket;
- Hawaii: the entirety of the Hawaiian islands (5 counties, but only 4 with DoD or VA beneficiaries)
- Gulf Coast: 18 counties; 7 in the western panhandle of Florida, 4 in southern Alabama, and 7 in southern Mississippi. Although this market is incongruent with the markets used for CARES planning, it is the current geographic area of responsibility of the VA Gulf Coast Veterans Health Care System, headquartered in Biloxi, MS.

These geographically-based Market area definitions are needed to obtain a planning perspective that is broader than that of a single facility. It is useful to also subdivide the Market area into smaller geographic units—Submarkets—for meaningful analysis. Submarkets are defined based on existing geo-political boundaries (i.e., ZIP codes, counties), taking into account topographical features that may practically distinguish one Submarket from another (e.g., rivers, mountains, highway patterns, etc.)

To continue with the example from the initial application of the methodology in the Joint Assessment Study, the Puget Sound market was divided along county lines into four Submarkets: North Sound, Seattle, South, and West Sound. Two of these regions contain both DoD and VA facilities; the other two contain only VA (Seattle) or DoD facilities (North Sound). Hawaii’s market was broken down by island boundaries into Kauai, Maui, Oahu, and The Big Island.¹ In the Gulf Coast, Submarket divisions used counties, creating five regions: Biloxi/Gulfport, Mobile, Pensacola, Eglin, and Panama City. These were based on geographic “clusters” of medical treatment facilities at approximately 40-mile intervals along the coast.

The designation of Market and Submarket areas are ultimately arbitrary; however, they are necessary to bound and limit the scope of the joint planning issues that the study is trying to frame and address. The Market and Submarket area definitions can be expanded or contracted to accommodate changes in these issues when applying this methodology.

Study Periods and the Planning Horizon

The Analysis Phase identifies and compares the service demand and system supply and capacity imbalances at specified points in time. There are three such points:

- Analysis or current year: The analysis or current year data should be the most recent full year of data. These data will establish the current baseline performance of the delivery system in the defined market area. In the initial application of the methodology, the analysis year was the 2002 federal Fiscal Year (FY 2002, October 1, 2001-September 30, 2002, inclusive).
- Base or reference year: The data for the base or reference year establish a common reference point for limited historic trend analysis through a comparison with data

¹ Mitretek used the submarket designation of “The Big Island” rather than “Hawaii” to avoid confusion with the market as a whole

from the analysis year. This initial study used FY 2000 and it is recommended that this base year remain the same for all future implementations of the methodology.

- Projection years: The projection years are the future horizon of the study results. The initial study used projection years in 5-year increments forward in time from the analysis year, for a total horizon of 20 years (i.e., 2007, 2012, 2017 and 2022).

Population

The methodology is grounded in a population-based paradigm, focused on the health care needs of the combined population of both DoD and VA beneficiaries in a market area. The population's size and demographic characteristics drive the demand for health care services and the utilization of facilities and staff in the market area.

This methodology creates a unique perspective for identifying the populations of interest—that of a Combined Beneficiary. A Combined Beneficiary is a current DoD, VA, or dually eligible beneficiary, for whom health care access, cost and quality would be improved if sharing and collaboration between DoD and VA were increased. Adopting this perspective positions the Analysis and Assessment Phases of the methodology to address the common and best interests of the Combined Beneficiaries in the Market as a whole, rather than the potentially conflicting interests of the two delivery Systems taken separately.

The methodology defines *population* as the total number of persons of a particular group or class residing in a given geographic area. There are three major beneficiary population groups whose data are included in the Analysis Phase:

- Eligible - Those persons determined to be eligible to receive health care services and other benefits from VA and/or DoD, due to their prior or current military service, or their status as a dependent of a current or retired military service member.
- Enrollees - Those eligible persons identified as potential users of health care services, and entered (enrolled) into the administrative systems of VA and/or DoD.
- Users - Those persons identified, via individual patient-level records of health care utilization, claims, or other transactions, as having actually used the health care services of VA and/or DoD during the analysis and/or base year.

A user is an individual who received health care services provided or paid for by the VA or DoD during the time period of the analysis. Understanding the service demands placed on the systems' resources by the current users—and how circumstances might change the numbers of users and the level of service demand in the future—is a primary focus of the methodology. Accurately describing current users and their utilization of health care services is the foundation for planning the resources required to most efficiently and effectively meet the current and future demands of DoD and VA beneficiaries.

Each population group—eligible, enrollees, and users—is described and categorized using relevant characteristics or demographics. These characteristics typically include their geographic location or origin (provided by the ZIP code of their residence) age,

gender, and beneficiary groups (e.g., beneficiary categories—or *BenCats*—in DoD: active duty, active duty family member, retired, etc.; in the VA, enrollment priority groups 1-8).

With respect to the definitions of the three population cohorts, three other elements of the analysis merit special attention and are discussed below.

Dual Beneficiaries

The primary factor in determining a veteran's eligibility to receive VA health care benefits is veteran status. Veteran status is established by active duty service in the military, naval, or air service, and a discharge or release from active military service under other than dishonorable conditions. In addition, since 1980 veteran status has required completion of 24 continuous months of active military service, with certain exceptions.² Most veterans are eligible to enroll and receive health care services from the VA.³

Although all veterans have served in the armed services, only some veterans remain eligible to receive health care services from DoD facilities after the completion of their active term of service. The methodology quantifies the number of these “dual beneficiaries” but the procedures differ depending on whether the estimate is for eligible, enrollees or users as follows:

- **Dual Eligible:** DoD maintains a detailed data set (DEERS, the Defense Enrollment Eligibility Reporting System) recording the eligibility of individuals to enroll for health care and other benefits. DEERS records both eligibility status and actual enrollment. However, VA does not maintain individual-level data on eligible veterans. It estimates the number of veterans in the general population from a variety of data sources, including Census data and DoD discharge data. The differences in the two approaches preclude estimating dually-eligible beneficiaries directly from individual-level data. Following the practice used in other studies of this type, the methodology uses the DoD retiree cohort—excluding their family members and other dependents—as a reasonable estimate of the dual eligible beneficiary population.
- **Dual Enrollees:** The methodology does not estimate the size of the dual enrolled cohort, because the enrollment status of veteran beneficiaries was obtained at an aggregate, market-area level, rather than at a detailed individual level. Such information is available, however, and could be used to provide an estimate of the dual enrolled cohort, following the methodology’s procedures for estimating dual users described below.
- **Dual Users:** The data collection protocols of this methodology produce individual-level records of health care utilization for all persons residing in the market areas of interest, who also used either DoD or VA health care delivery systems. DoD data identifies individuals using true Social Security numbers (SSN); however, because of privacy concerns, VA data identified individuals using scrambled Social Security

² Department of Veteran Affairs web site, www.appc1.va.gov/clig/

³ As of January, 2003, the ability of some eligible veterans to enroll has been restricted.

numbers (SCRSSN). The methodology incorporates the following steps to estimate the dual user cohort:⁴

- Mitretek developed a “finder file” containing the SSNs of known users of the DoD system, and provided this finder file to the VA’s Austin Automation Center (AAC).
- AAC staff used this finder file to match against the VA’s utilization files (i.e., Patient Treatment File (PTF) and the Outpatient Care (OPC)) to identify those DoD beneficiaries also receiving care from the VA;
- AAC staff returned two files to Mitretek:
 - The original finder file, containing real SSNs, modified to indicate which DoD beneficiaries received VA care. This file was coded to indicate whether the individual received care from a VA facility, had their care paid for by the VA, or both.
 - A separate file, with the same data, but with the VA SSCRN rather than real SSN.

These two files enable the methodology to both describe the dual user cohort, in terms of its size, demographic and other characteristics, and describe the volume and characteristics of the health care services received by the dual user cohort in each system. These estimates are at an aggregate level however, and cannot describe the services received by a specific individual in both systems of care.

Market Users and Facility Users

The individual-level records of health care utilization incorporated in the methodology enable a count of the number of unique persons living in the Market⁵ area who receive health care services from the VA and/or DoD, regardless of whether the services were provided in or outside of the Market area. The methodology defines this unduplicated count (i.e., each user is counted only once) of users as *Market Users*.

However, each facility where care is provided also counts the number of “its” users, and at the facility level this is an unduplicated count as well. Because each user may visit one or more health care facilities, both in and outside of the market, and users may also come into the market to receive care, the sum of users counted at each facility—*Facility Users*—is larger than the number of Market Users.

Market Users is correctly used when the Analysis is based on the perspective of a Market or Submarket, i.e., a population-based perspective. *Facility Users* is correctly used when the Analysis is based on the perspective of one or more facilities.

Markets and Migration

⁴ The procedures described would not be necessary in a potential future study, if VA agreed to make the its utilization data available to the Analysis team with true SSNs. Alternatively, DoD and VA could develop a common method or algorithm to de-identify the data by scrambling the true SSNs, so that the beneficiaries of both Systems could be readily identified in the utilization records of the other.

⁵ Market Users by definition include Submarket Users.

An additional clarification on *Facility Users* is necessitated by juxtaposing the specific geographically-based Market definitions and the methodology's Combined Beneficiary perspective. A user residing in a Market may receive health care services from facilities also located in that same Market. Alternatively, a user may travel to facilities outside the Market to receive care, and many users exhibit both behaviors in the same time period.⁶ The methodology describes the former as *In-market*, and the latter as *Out-migration*.

Similarly, a user residing outside the Market may travel into the Market to receive care; the methodology describes this as *In-migration*.⁷ While defined in this section as applying to users, this terminology also extends⁸ to the volume of services and facility workloads generated by these users, as described in the next section.

Demand and Workload

This component of the Analysis Phase focuses on the health care services used by the population during the Study periods. The objective of this component is to describe and classify the demand for clinical services from DoD and VA users residing in a Market, and then quantify the total volume of workload accommodating this demand, by type of clinical service at each facility. These services are measured in workload units that are consumed by the population. The workload units are defined by the metrics utilized by each Department (e.g., discharges, bed days of care, visits, clinic stops, etc.)

Inpatient and outpatient service workload volumes are described and measured somewhat differently by each Department. To insure consistency in results for the current and potential future studies, the methodology incorporates a Product/Clinical Service Line "crosswalk" that includes a standard set of clinical service definitions — incorporating the product and clinical service categories of both DoD and VA into a consistent set of definitions that are applicable to both systems — for classifying the range of inpatient and outpatient services provided by the two systems. Creating these common service categories was essential to combine the DoD and VA data into a single marketplace view of the health care services used by the two beneficiary populations.⁹

The basic metrics used to determine service workload volumes for both inpatient and outpatient services are described briefly below:

Inpatient Services

There are two basic units of measure for inpatient services that are used to quantify demand: number of episodes and episode length. Although episodes can be enumerated using either the discrete start (admission) or end (discharge) dates of the episode, discharges are used in the study since it is the unit of measure most commonly used in health care market planning and analysis. The duration of an inpatient episode is the

⁶ This describes the "snowbirds," who temporarily relocate to warmer climates during the winter months. It also applies to DoD users, a significant number of whom are annually reassigned.

⁷ Logically, there is a 4th category, but users who reside outside a Study Market, and who use facilities outside a Study Market, are by definition not within the scope of the Study.

⁸ The logic of In-Market, In- and Out-migration also extends to enrolled populations in DoD, where a person is typically enrolled at a specific facility.

⁹ The Product/Service Line Crosswalk is Attachment 3 to this Appendix.

second basic unit of measure of inpatient workload volume. Formally termed Length of Stay (LOS), it is measured by the difference between the episode start and end dates. Average Length of Stay (ALOS) for inpatient episodes of comparable types is a basic tool for evaluating the performance of a health care delivery system compared to expected or normative values for ALOS. Finally, a total bed days of care (BDOC) required for inpatient services can be derived by aggregating the length of stay for each inpatient episode for a given time period (usually on an annual basis). The methodology uses discharges and BDOC by work unit/MEPRS code, summarized into product and service lines, to determine inpatient volume.

Outpatient Services

There are several potential units of measure for outpatient services workloads:

- **Trip:** A care-related appearance by a single person at a single facility on a single day.
- **Visit/Clinic Stop:** An appearance by a person at an ambulatory care clinic, by type of clinic. Multiple visits (individually called “clinic stops” in the VA and “clinic visits” in the DoD) to different clinics (e.g., primary care, radiology, pharmacy, etc.) can be associated with a single trip.
- **Encounter:** A term in broad use in health care typically meaning an interaction between a patient and a clinician. Multiple encounters may actually be associated with a clinic stop or clinic visit.
- **Procedures:** Procedures or treatments received are also recorded, using industry-standard codes such as Current Procedural Terminology (CPT-4) or International Classification of Diseases (ICD-9) procedure codes. Multiple procedures may actually be associated with a single visit or single encounter.

As with bed days of care (BDOC) for inpatient services, the multiple units describing outpatient workload volumes provide a comprehensive and detailed method for linking the health care needs of individuals with the delivery system’s resource requirements. For example, ICD-9 and CPT-4 procedure classification schemes typically have a very large number of codes (CPT codes exceed 9000). This level of detail can provide great specificity and can be aggregated using standard groupers for summarizing detailed data into more manageable increments (the Product/Clinical Service Line “crosswalk” described above is an example of a grouper). Further, other reference tools, such as the Berenson-Eggers Type of Service (BETOS) codes used by the Centers for Medicare and Medicaid Services (CMS), permit arraying the voluminous outpatient care workload into other potentially useful views. The methodology uses visits/clinic stops, summarized into product and service lines, to determine outpatient workload.

Ancillary Services

Ancillary services include such activities as surgery, imaging, and radiation therapy. There are several measures of ancillary services, depending on the activity. These include:

- **Visit/Clinic Stop:** An outpatient appearance by a person at an ancillary service.

- Procedures: Procedures are measured using Current Procedural Terminology (CPT-4) or International Classification of Diseases (ICD-9) procedure codes. Multiple procedures might be associated with a single visit.
- Departmental Logs of Workload: Frequently, an ancillary department keeps records of its inpatient and outpatient workloads for purposes of staff and schedule planning.
- Inpatient Diagnosis-Related Groups (DRGs): Some ancillary activity on the inpatient side can be assumed based on certain DRGs. For example, surgical DRGs can be assumed to have generated a case in the operating room.

Measuring relevant operational workload statistics in ancillary services can be difficult. The purpose of the Analysis Phase was to compare demand to capacity in these services, and as a result, it is necessary to derive volumes at an appropriate level to compare against the facility's or staff's ability to support those volumes. CPT-4/ICD-9, which is available at the medical record level, is usually too fine a level of detail for measuring demand for staff and facilities. But since ancillary departments often provide services to both inpatients and outpatients, outpatient-based visit data do not provide sufficient detail. One way of obtaining demand data for ancillary services is to survey the hospital or clinic for its departmental log data. Managers of departments use this level of data to determine their staffing and schedule, and it is thus the data most directly related to capacity. In addition to surveying the departments, the methodology also includes Demand Conversion Factors for converting record-level detail into the required operational workload statistics. Examples of these included:

- Surgery: For each unique combination of person and date, combining all surgical DRGs and all clinic stops/visits to ambulatory surgery to estimate surgical case workload for both inpatient and outpatient settings.
- Cardiac Catheterization: For each unique combination of person and date, combining all catheterization/electrophysiology-related DRGs and all ambulatory clinic stops/visits to the catheterization lab to estimate catheterization case workload.
- Imaging and Radiation Therapy: For each unique combination of person and date, for each imaging modality (e.g., MRI, CT scan, etc.), count the visits where modality-specific CPT4 code appears at least once, to estimate cases for that modality.

Please see *Attachment 7* for supporting documentation about Demand Conversion Factors.

Types of Care

Both DoD and VA provide services to their beneficiaries from health care facilities operated and controlled by each System. Following DoD convention, the methodology terms this type of care as *Direct Care*, i.e., provided directly to beneficiaries by the System to which they "belong." Both Systems also pay for services provided to their beneficiaries by other parties; this is referred to as *Indirect Care*.

Within DoD, Direct Care is concentrated on those who enroll in the "TRICARE Prime" plan, where Military Treatment Facilities (MTFs) are the principal providers of health care

services. All other TRICARE options¹⁰ are considered Indirect Care for purposes of the Analysis. However, the Analysis also captures within the Direct Care workloads at each MTF that portion generated by non-Prime enrollees who may occasionally use the MTFs for some services. Similarly, Indirect Care includes the workloads generated by Prime enrollees who may elect or be directed to non-MTF providers for a variety of reasons, including beneficiary satisfaction, lack of capacity in a particular service or specialty, long waiting times, disruptions due to deployment, etc.

The VA also has Indirect Care, but unlike DoD does not allow its beneficiaries to enroll in insurance-type plans to receive services as an alternative to VA Direct Care. Rather, the VA will pay for medically necessary services required by its users, but either not available within the VA, or not available in a timely manner. Within the VA, this is referred to as Fee-basis care. For consistency of terminology, the methodology categorizes this as Indirect Care.

The combination of Direct and Indirect care services received by a Market's users provides a relatively complete picture of the total service demands generated by the beneficiary population residing within the Study Market. The ability of the facilities within the market to meet their share of this demand depends upon their available resources and their capacity to provide these services. These are described in the section that follows.

Current and Future Demand

In addition to estimating current demand, as described above, the methodology encompasses an estimation of future demand.¹¹ The methodological approach to estimating demand, current or future, is grounded in a population-based paradigm, assuming that the demand for services placed on a health care delivery system will arise from the size and demographic characteristics of the population the delivery system is intended to serve. As the characteristics of the population change, the shape of the demand (the specific pattern of type, frequency, and volume of services) also changes. Developing a replicable methodology that is sufficiently robust to apply in potentially very different local health care markets places a premium on identifying and understanding the specific characteristics of the populations that are driving the demand for health care services in these markets.

The demand for health care delivery system capacity arises from the interaction of a number of factors, in particular:

- The number and characteristics (e.g., age, gender, ethnicity, geographic location, ability to pay, etc.) of the eligible and enrolled populations within the defined market area served by the delivery system

¹⁰ These include insurance-type plans such as TRICARE Extra, a Preferred Provider Organization (PPO) option; TRICARE Standard, a fee-for-service or indemnity-type option; and TRICARE for Life (TFL), in which TRICARE provides "Medi-gap" type coverage for Medicare-eligible (i.e., 65 years of age and older) beneficiaries.

¹¹ Future demand was not estimated in the Joint Assessment Study.

- The number and characteristics of those members of the overall population who actually use the delivery system
- The specific characteristics of their use (e.g., type of services used, frequency of use, intensity/ depth of use, facilities visited, etc.)

Provided that the demographic and other characteristics of both current and future populations can be described in detail, future demand is estimated in this methodology from current demand via use rates for each type of service. A use rate is a ratio of the annual volume of a specific type of service to a specific population cohort. An example inpatient use rate calculation for different population cohorts is shown in the table below:

Example: Use Rates

MARKET	Eligible Population			Enrolled Population			Actual Discharges (Incl. OB & Behavioral Health)		
	DOD	VA	Total	DOD	VA	Total	DOD	VA	Total
Mkt A Total	258,304	250,633	508,937	188,318	61,805	250,123	15,579	5,995	21,574
Use Rate/1,000	60.31	23.92	42.39	82.73	97.00	86.25			

This table is an example of use rates that can be derived from the methodology’s data repository. It shows the Eligible and Enrolled Populations and the actual 2002 inpatient discharge volumes generated by that population within the DoD and VA systems (including out-migration, but Indirect Care volumes are not included in this example). With these data, a total Use Rate Per 1,000 Population can be derived for the Study Market.

Use rates provide the population-based metric to project the demand in a Market from the current year to the future projection years. The methodology assumes as a default that the use rates by population cohort will remain constant, unless there are factors known to the analyst (e.g., known policy changes) that will change future use rates.

Supply and Capacity

This component of the Analysis Phase identifies, describes and measures the physical characteristics of health care delivery facilities in the Market, the characteristics of key clinical staff at these facilities, and other resources that in combination supply or deliver the health care services demanded. Additionally, the methodology converts these data into estimates of the capacity at each facility available to meet the demand.

Resources

Key delivery resources that determine the productive capacity of a treatment facility include the number of inpatient beds, operating rooms, clinic exam rooms, procedure rooms, major diagnostic and treatment equipment (e.g., MRIs, PET scanners, linear accelerators, etc.), administrative and office space, and the number of clinical staff resources (e.g., physicians, physician extenders, nurses, technicians, etc.).

The methodology requires that these data be obtained and developed using survey documents¹² and site visits as the primary data collection mechanism. During the initial application of the methodology, Mitretek visited and reviewed each of the DoD and VA facilities located in the study market areas to count and characterize those facilities and staff resources. The facility resources were measured in terms of both quantity and quality; in addition to a physical count (quantity) of the facilities, quality in terms of condition or useful life remaining was also identified. Buildings were characterized by age, plant replacement value, and functional quality of the space (e.g., size versus standards, critical adjacencies, etc.).

Additionally, the methodology obtains the number of available Full-Time Equivalent (FTE)¹³ staff for each clinic and inpatient treating specialty at each facility from the relevant DoD¹⁴ and VA¹⁵ central data sources.

Capacity Conversion Factors

The current supply of key productive resources at a facility is expressed in terms of counts. These counts are then translated into workload capacity using Capacity Conversion Factors. Capacity conversion factors (e.g., visits per physician per unit time, surgeries per OR, etc.) are metrics that express the per unit volume of services that can be expected to be accomplished within the facility, based upon the supply of resources available. This translation of supply counts into capacity defines how much workload can be accommodated by this facility over time, given the current counts of facility resources and clinical staff. Any location-specific constraints to the throughput possible (e.g., staffed beds versus available beds) affecting the capacity calculation are also taken into account in the methodology.

Capacity Conversion Factors were created for the initial study for both inpatient and outpatient services. These factors enable supply data such as staff, equipment, and space to be converted into a workload capacity to support workload demand. To the extent possible, these factors are derived by researching DoD's and VA's own standards or by using factors employed in other DoD and VA studies. "Private sector" benchmarks are also researched (such as Medical Group Management Association). Examples of conversion factors include:

- Primary care visits per clinical FTE per hour
- Specialty care visits per specialty clinical FTE per hour (distinct for each specialty)
- Annual cases per operating room
- Exam rooms per provider
- Maximum inpatient occupancy percentage

¹² See Attachment 7 for survey instrument

¹³ An FTE is defined as a work force equivalent of one individual working full-time for a specific period, which may be made up of several part-time individuals or one full-time individual. *Glossary of Health care Terminology (DoD 6015.1-M, January, 1999)*.

¹⁴ Medical Expense and Performance Reporting System (MEPRS).

¹⁵ Account Level Budget Cost Center (ALBCC) data sets for each VA facility, from the VA's Decision Support System (DSS) National Data Extracts.

- Annual patient days per inpatient nurse by care type
- Annual number of CT scans per scanner

The methodology’s capacity conversion factors are the tool that estimates the potential workload capacity of an organization’s resources, and will highlight potential sharing opportunities at a very high level. The methodology’s intention is to identify examples of demand and supply imbalance. The capacity conversion factors, per se, are *not* benchmarks intended to evaluate the productivity of a department or staff.¹⁶

In the initial application of the methodology, Mitretek recognized that the capacity conversion factors within a particular department or area may provide different and potentially conflicting results, depending on the resource and factor used to convert it. For example, primary care capacity could be estimated based on the actual number of clinical provider FTEs, using visits per provider per hour and annual hours available. However, using space factors such as FTEs supported per exam room or departmental gross square feet (DGSF) to estimate rather than count FTE, may show that while FTEs may be available, the physical space available may drive a lower bound to the estimate of capacity, as shown in the table below. From an analysis perspective, using different and somewhat independent factors to convert resources into capacity helps to bind the capacity estimates in the Analysis, providing more robust and potentially more stable basis for future planning.

Estimating Workload Capacity Based on the Supply of Different Resources

Example	Resource Base	Logic	Result Annual Visit Capacity
1	FTEs as base	1. 7.3 actual Clinical FTE’s x 3,051 annual visits per Clinical FTE	22,277
2	Exam Rooms as base	1. 10 exam rooms/2 exam rooms per provider = 5 FTE supported capacity 2. 5 FTE capacity x 3,051 annual visits	15,255
3	DGSF as base	1. 10,000 DGSF/1200 DGSF per provider = 8.3 FTE supported capacity 2. 8.3 FTE supported x 3,051 annual visits	25,323

For this methodology, Mitretek developed capacity conversion factors for multiple primary care, medical, and surgical specialties. The FTE for these factors are “Clinical Full Time Equivalents,” which are derived from the time clinical staff spent in an outpatient clinic. For example, two full time surgeons each spending only 50% of their time in the clinic (and the other 50% in the OR) would yield one Clinical FTE. The conversion factors for clinical providers were developed as follows:

¹⁶ However, large imbalances between potential workload capacity and actual workload demand could reflect low productivity.

- Using actual DoD and VA data, developed visits per clinical FTE-hour factors for medical and surgical specialties in the three market areas.
- Developed a volume-weighted average of the values for DoD and VA to derive a “Federal Composite” of visits per hour by specialty.
- Used data from the Medical Group Management Association (MGMA)¹⁷ to develop visit per hour factors for providing medical and surgical specialties in both academic¹⁸ and non-academic settings.
- Compared the Federal Composite to either the MGMA median for physicians who work 40+ hours (pediatrics, internal medicine, family practice) or to the MGMA median for academic practices (all medical and surgical specialties).
- The midpoint between the Federal Composite and the MGMA standard was used as the capacity conversion factor for the initial Joint Assessment Study.¹⁹

Example: Calculating Capacity Conversion Factors: Internal Medicine

DoD Visits Per Hour in Study Market	VA Visits Per Hour in Study Market	“Federal Composite” (average of DoD and VA)	MGMA Median for Physicians Who Work 40+ Hours	Conversion Factor (median of Federal Composite & MGMA) for the Study
1.41	1.43	1.42	2.04	1.73

To estimate the available capacity to provide services at each facility, the methodology applies the following equation, for each specialty:

$$\text{Annual Capacity (visits)} = \text{FTE Supply} \times \text{Capacity Conversion Factor} \times \text{Annual Hours}$$

Where:

- **FTE Supply** = the number of FTE in a particular specialty or Clinical Service Line;
- **Capacity Conversion Factor** = an estimate of the average capacity of one FTE provider in that Clinical Service Line, as the number of visits that can be performed in one hour; and
- **Annual Hours** is the number of annual hours that one FTE provider is assumed to be available to provide services; this is also the basis for what is considered to be the equivalent of “full-time.”

In determining Annual Hours, the methodology recognizes that the definition of full-time equivalency differs between DoD and VA. DoD’s MEPRS system calculates and reports

¹⁷ MGMA Physician Compensation and Production Survey, 2002.

¹⁸ An academic setting is one associated with a graduate medical education program in one of the primary care Clinical Service Lines/medical specialties. Because of the additional time needed to achieve instructional objectives while engaged in delivering patient care, productivity in terms of visits per hour is typically lower in these settings, compared to non-academic settings.

¹⁹ The full set of FTE visit per hour factors developed is included as Attachment 4 to this Appendix. Other capacity conversion factors are also included as Attachment 5.

FTE by dividing the monthly hours recorded by 168 available hours per month, or an annual FTE basis of 2,016 hours. VA uses a standard federal work year of 2080 hours, or 40 hours per week for 52 weeks. When an allowance for holidays is taken into account, DoD and VA are using an FTE basis of approximately 2000-2016 hours. In the methodology, the DoD FTE basis of 2016 hours is used as a reasonable estimate of full-time equivalency.²⁰

However, not all of these hours could, in reality, be expected to be completely productive with respect to providing primary care services; DoD military providers in particular are expected, as part of their daily routine, to attend to their military-unique duties, which may not be accounted for elsewhere in the MEPRS system. Therefore, the methodology assumes that 1 hour per day, or 12.5% of a typical 8-hour day, would be non-productive with respect to providing patient care. Applying this 12.5% reduction to the FTE basis of 2016 hours yields an adjusted value of 1764 Annual Hours per FTE position.

Access and Cost

The Analysis Phase of the methodology concentrates on developing a baseline description of each Market, which is then used to identify and assess options for change—specifically involving sharing and collaboration between DoD and VA—in the Assessment Phase. In addition to developing an initial comparison of demand and supply, the baseline also includes a “performance” baseline for access to services, and the cost of providing these services. A brief description of the access and cost baselines is provided here; more detailed descriptions of these performance dimensions are provided in the Assessment Phase that follows.

Access

Both DoD and VA use comparable performance standards for evaluating geographic access to health care services: access is considered acceptable if services are located within specified “drive-time” distances a beneficiary’s residence, as shown in the table below:

Access/Drive Time Standards			
(minutes)	DoD	VA	VA Rural
<i>Primary Care</i>	30 Min.	30 Min.	30 Min.
<i>Specialty Care</i>	60 Min.	60 Min.	90 Min.
<i>Inpatient Care</i>		60 Min.	90 Min.
<i>Tertiary Care</i>		240 Min.	in VISN

Because specific address information is not readily available in the person-level utilization data, the methodology uses ZIP-code centroids as a proxy for location of residence, and conducted drive-time analyses using GIS software. The drive-time

²⁰ It is important to distinguish between the productive capacity of an FTE position, which may by definition be filled by more than one individual, and what a single individual’s annual productive work hours might total. This analysis deals with the former, including and summarizing but not explicitly addressing the latter.

analyses identified that proportion of the current enrollees and in-Market workload, for both inpatient and outpatient services met the above drive-time access standards. These proportions, expressed as percents, establish the access performance baseline for each Study Market and Submarket.

Cost

The cost performance of a particular sharing opportunity, or a set of opportunities bundled into one or more scenarios, is measured by incremental changes to the total annual system cost in a particular market. The total baseline system-wide costs are established using the analysis year data (FY02 for the initial study). These are the costs required to fund the care provided to the combined beneficiary population in the Study Market, and include the annual costs associated with:

- direct care services provided by the DoD and VA facilities located *within* the Study Markets to DoD and VA beneficiaries who reside within the Study Market area;
- direct care services utilized at *other* DoD and VA facilities outside the Study Market by beneficiaries who reside within the market area; and
- indirect care services that are purchased from other providers by DoD and VA for their beneficiaries who reside within the Study Market area – i.e., purchased care.

Using the current year cost data for each of these components of care delivery (i.e., all services provided directly by DoD and VA facilities either within or outside the market and those services purchased by DoD and VA for their beneficiaries who reside within the market area) the methodology creates a complete picture of the total annual costs funded by DoD and VA to care for the Market beneficiary population and establishes the baseline system costs for each market.

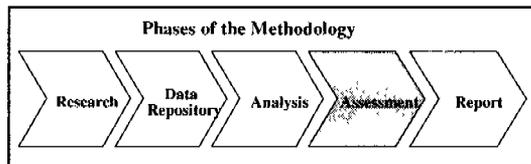

Initial Comparison

At the conclusion of the Analysis Phase, an initial comparison of demand and supply at each facility within a Market and/or Submarket is prepared as an input to the Assessment Phase. This comparison identifies and highlights both shortages of and excess capacity for each type of service, i.e., Primary Care, Medical and Surgical specialties (by specialty or service line), routine Acute Inpatient Care (by specialty or service line) and Tertiary Inpatient Care (by specialty and service line). Additionally, the access and cost baselines performance values, specific to each care type, accompany the initial comparison of demand and supply. The table below shows a generic representation of an initial comparison for Market, for Primary Care visits, that results from application of this methodology.

Example Initial Comparison (Primary Care)

Submarket	Facility	Baseline Workload (Visits)	Net Capacity Available/ (Needed)	Current Capacity (Visits)	Cost per Visit
A	Navy 1	50,774	7,329	58,103	\$156
	Navy 2	17,300	1,871	19,171	\$167
B	VA 1	98,330	24,135	122,465	\$170
C	AF 1	33,000	1,823	34,823	\$154
	VA 2	80,994	(8,514)	72,480	\$142
	Army 1	264,046	20,425	284,471	\$139
D	VA 3	4,190	4,990	9,180	\$172
	Navy 3	20,352	(1,617)	18,735	\$150
	Army 2	76,982	39,985	116,967	\$151
Total		645,968	90,428	736,396	\$162
Access Performance %		74.2%			

3.4 Assessment

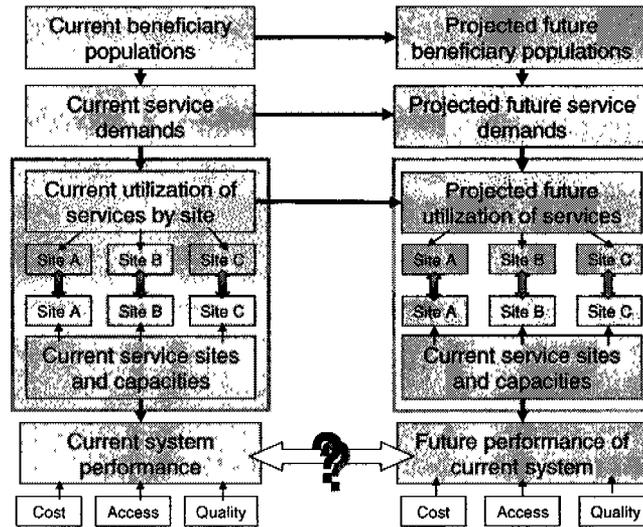

The methodology includes interdependent quantitative and qualitative aspects, leading to a holistic approach. The quantitative analysis and assessment can identify promising opportunities for increased sharing and collaboration by showing the “numeric” impact of rationalization or redistribution of access points and providers. While the quantitative/numeric outcome might appear quite *desirable*, it might not be completely *feasible* due to the numerous mission, policy, infrastructure, and organizational culture issues that raise practical barriers to implementation. The quantitative assessment highlights the *numeric impact* of a change and the qualitative analysis highlights the *organizational impact and readiness* for change.

Quantitative

A key component of the methodology is the identification of the differences between the current and projected future workload demand generated by the population and the workload capacity of the current supply of DoD and VA resources available. Demand and supply need to be expressed in the same units of measure. The current time horizon compares the current service demand by location with the supply by location and identifies imbalances. The imbalances projected in the future time horizons contrast the current supply and capacity with projected future service demand based upon changes projected for the population. The current patient populations by submarket areas and their

migration patterns are also analyzed to determine the system capacity requirements based on where patients live as well as based upon where DoD and VA facilities are located. The figure below illustrates the process for assessing the demand and supply imbalance for both the current and future time horizons.

Demand/Supply Imbalance – An Illustration

Demand and Supply Imbalance - measuring current and potential future performance

As the population-based demand and the capacity of the current supply are viewed over the time horizon of the study, there are four potential imbalances that might be observed as depicted in the charts below.

Demand/Supply Imbalances

Demand and Supply Imbalances - there are four possible scenarios

The demand and supply imbalances can be viewed over time for the DoD alone, for the VA alone, and for their combined capacity. It is these demand/supply imbalance

conditions for specific services and/or specific geographies within the study market that will focus the identification of sharing options for the study. If there is a permanent excess of capacity projected compared to future demand, then the options should focus on reducing excess capacity or potentially increasing demand (if by moving patients from other service sites might improve access for these populations). If the DoD has permanent excess of capacity projected for a specific service while the VA has permanent shortage of capacity in this service, but the combined view has sufficient capacity, then options will be identified that focus on using the DoD excess to accommodate the VA shortage.

Baseline Access and Cost Performance

In addition to identifying the workload imbalances, other pertinent system performance factors are identified and measured. These factors include level of access (e.g., both in travel time and distance as well as wait times), cost measurements at a location level (including both variable and fixed costs), and service quality (e.g., patient satisfaction). With this data, the current and projected future system performance against DoD and VA guidelines and benchmarks for access, quality, and cost can be evaluated.

Using these factors, the methodology quantifies the current combined DoD and VA system performance in the study market area in meeting the needs of their beneficiaries in terms of access to services, service quality, and the costs incurred by DoD and VA, and then projects future system performance in the market based on the current delivery system capacity and the projected future workload demand from the population in terms of beneficiary access, service quality, and costs. Finally, the methodology identifies areas of opportunity for greater DoD and VA sharing and integration in either the current and future organization of the delivery system based upon the potential to improve access, service quality, and costs to the system.

Framework for Developing the Options

A primary objective of the study methodology is to explore sharing options focused on collocating or sharing facilities and care providers in areas where duplication and excess capacity may exist for each market area and to identify the most promising opportunities to be pursued. Given this objective, the methodology is structured to measure total service demands of the combined DoD and VA populations and contrast these with the current supply of DoD and VA resources in order to determine where current and future imbalances between the demand and the supply in a particular market might exist. The methodology identifies those sharing and integration options available and quantifies their projected impact on current or future demand and supply imbalances. The alternatives may have a facility, staffing, support service, information system, or other resource or organizational implications.

The objective is to recognize the options where greater sharing of DoD and VA programs and services could have a beneficial impact. The following examples of imbalances that may be observed in the data illustrate examples that would trigger identification of alternatives:

- Below standard current performance indicators for access, cost, or quality
- Significant service area overlaps or duplication of services and resources
- Over- or under-utilization of existing capacity (staff, facilities, equipment)
- Lack of availability or access to specific services for specific beneficiary populations

By considering both the current imbalance measured for the market and the environmental assumptions for the future over the planning horizon, targets of opportunities for potential sharing are established. The largest imbalances are prioritized as focus areas for potential sharing opportunities. These imbalances can be either over or under capacity as compared to the required demand. Then alternate care delivery options are identified based on common services to be provided to the market population. These alternatives can include alternate location of service options or alternate delivery system options. These options should also consider any already planned DoD and VA changes, including planned increases or decrease in supply or capacity, new care delivery structure, and new joint ventures or sharing strategies. The potential impact of the alternatives should then be quantified in terms of access, service quality and cost.

The methodology focuses the assessment of the impact of changes to the current situation based on the principal criterion of demonstrably positive benefits to eligible beneficiaries in term of enhanced access and/or service quality and to the taxpayers in terms of lower cost. To allow for a more systematic process for identifying the range of sharing opportunities that might exist in any study market, a standard step-by-step approach that can be applied across all markets has been incorporated as part of this methodology. This approach focuses first on *desirability* from the beneficiaries' and taxpayers' perspective based on improving access and quality and reducing costs. This approach temporarily suspends the consideration of significant "real world" barriers to sharing (such issues as base security, IM/IT, credentialing/privileges, reimbursement and leadership/governance) to first measure the expected "benefits" to beneficiaries and taxpayers (e.g., access improvements and/or cost savings). Once the expected benefits are determined, the study methodology considers their *feasibility* by identify the specific barriers and impediments to implementing any particular sharing option that exists, and assessing if the option can feasibly be pursued. The qualitative component of the Assessment provides a framework for understanding these barriers.

The methodology's generic framework for developing the potential options for change to be analyzed based upon the current system access and cost performance and demand/supply imbalances documented within the combined DoD and VA market is as follows:

A. Rationalize Primary Care

- Step 1: Rationalize Access to Existing Service Sites: open access across the two Systems
- Step 2: Rationalize Volume at Existing Service Sites: right-size capacities after Step 1
- Step 3: Consolidate Duplicate Service Sites: if excess capacity still exists
- Step 4: Create New Access Points: if required to meet primary care access standards

B. Rationalize Specialty Care and Inpatient Care

- Step 1: Open DoD providers to VA patients and VA providers to DoD patients
- Step 2: Rationalize Volume at Existing Service Sites: right-size capacities after Step 1
- Step 3: Consolidate Duplicate Service Sites: if excess capacity still exists
- Step 4: Create New Access Points: if required to meet access standards

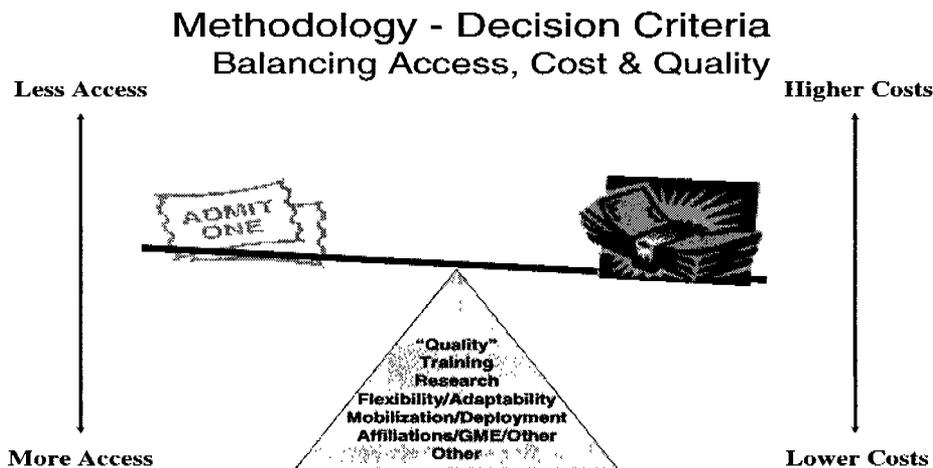

C. Rationalize Tertiary Care Services

- Step 1: Consolidate select programs: if duplication exists and volume below thresholds
- Step 2: Consolidate facilities: if a single facility can accommodate the required workload

Applying this framework for developing the potential options, in addition to the identification of sharing opportunities that are incorporated in the methodology through the site visit data collection processes, will help to facilitate the identification of the full range of potential sharing opportunities that can be evaluated for any study market area.

Weighing the Options – Decision Criteria

The methodology prioritizes the most promising sharing and integration options based upon the magnitude of the projected impact on future access, service quality, and cost. This activity applies consistent decision criteria to measure the relative costs and benefits of each alternative sharing and integration option that has been identified. The option evaluation may show that the projected impacts can have opposite effects on the baseline system as illustrated in the figure below.

Balancing Access, Cost & Quality - When access is easier for users, costs may rise due to a greater number of access points or care providers. Conversely, if cost savings are effected (e.g., reduced staff or closing a facility), this could potentially diminish users' access to health care services.

The first step in the decision analysis process is to measure the incremental impact of change on access (at facility and location), service quality (to the extent metrics are

available), and cost (projecting future operating costs incorporating any required incremental investment cost) for each of the alternative options. Next, the projected “second order” impacts are assessed and incorporated into the decision criteria as illustrated in the table below. The options are then prioritized with the first order impacts (access, quality, cost) having a higher influence on the ranking than the second order impacts.

Measuring Impact on Access

DoD and the VA have published access standards for health care services. Both already use the concept of drive times, which are fairly easily quantifiable. The DoD and VA define their access standards as follows:

Access/Drive Time Standards

(minutes)	DoD	VA	VA Rural
Primary Care	30 Min.	30 Min.	30 Min.
Specialty Care	60 Min.	60 Min.	90 Min.
Inpatient Care		60 Min.	90 Min.
Tertiary Care		240 Min.	in VISN

Based on these types of drive time standards, the VA defines “access gaps” based on where enrollees reside. For Primary Care, a gap exists if less than 70% of enrollees live within the 30-minute drive standard and more than 11,000 enrollees are outside of the 30-minute area. For Inpatient Care, a gap exists if fewer than 65% of enrollees live within the 60-minute standard and at least 12,000 enrollees are outside that area. For tertiary care, an access gap is defined as fewer than 65% of enrollees within 240 minutes drive of any facility, with at least 12,000 outside that standard.²¹

The drive time analysis should answer the questions:

- How accessible and convenient are the locations of the facilities, for each System, given historical migration patterns?
- Are there access gaps that need to be addressed?
- Can access be improved through co-locating or sharing of facilities?

The drive time analysis can also be used to assess the impact on the populations served of opening a new access point (clinic, hospital, etc.) or closing an existing facility. Achieving a higher percentage of people within the drive time standard equates to an increase in access.

This methodology uses ArcView® GIS and its Network Analyst module to determine drive time areas. The facility sites are added to the market area map, and road and ferry route network files are downloaded from the US Census (TIGER files). A standard road classification table, which includes speed limits and traffic signals (lights and stop sign locations), is added to the map file. The Network Analyst is then run to determine 30, 60

²¹ SOURCE: National CARES Plan, Appendix P <http://www1.va.gov/cares/docs/DNP_appP.pdf>

and 90-minute drive time “rings” for each facility in the market area. The drive-time rings are used to select ZIP code centroids, assuming that the majority of the population within a given ZIP code will access the facility in roughly the same amount of time. The numbers of eligible population, users, enrollees, primary or specialty care visits, and inpatient discharges by the ZIP code of residence are then compared to the drive-time “rings” to determine the percentage of people/visits that are within the drive time standards.

After the data for a baseline year are determined, change options can be examined and their potential impact on access can be quantified. Population projections for future years can be used to forecast future demand and any changes on current baseline access percentages can be measured. New primary care access points can be added and the populations within the newly created 30-minute drive time areas can be counted to determine by how much the access to health care services is improved for the submarket and market. Access can be opened to the population to facilities of either system, and that increase in accessibility can be quantified. These percentages were used to determine by how much the particular option increases or decreases access and to thus evaluate the relative desirability of a given option against each of the others.

Measuring Impact on Operating Costs

The cost of providing health care to the DoD and VA beneficiaries is another important criterion for assessing current delivery system performance that is considered in this study methodology. The total cost to the federal government to provide health care to these beneficiaries, now and in the future, is probably the single most relevant metric for assessing the combined DoD and VA system’s performance from the taxpayer’s perspective within any study market area.

The components of cost that are included in the methodology data repository and the approach for using these data to measure the impact on total system cost of alternative sharing options for care delivery during the Assessment Phase are summarized in the following sections.

Cost Components

In reviewing the collected data, the following two views of the total annual cost of providing health care to the DoD and VA beneficiaries can be quantified for any study market: (1) the total cost incurred for providing care to the study market beneficiaries; and (2) the total cost of the care that is provided by the DoD/VA facilities within the study market area. The major components of the annual cost data that comprise each of these two perspectives on total system cost are illustrated in the table below.

Beneficiary Populations	Annual Cost of Direct Care Delivered by Market Area DoD/VA Facilities		Annual Cost of Direct Care Delivered by DoD/VA Facilities Outside the Market		Annual Cost of Care Purchased for Beneficiaries by DoD/VA from Non-DoD/VA Facilities		Total Annual Cost of Care Provided to Defined Study Market Beneficiaries and Financed by DoD/VA		
	DoD	VA	DoD	VA	DoD	VA	DoD	VA	Total
Beneficiaries Who Reside in the Defined Study Market	\$	\$	\$	\$	\$	\$	Total Cost for Market Beneficiaries		
Other Beneficiaries Using Study Market DoD/VA Facilities	\$	\$	x	x	x	x	x	x	x
All Beneficiaries Using Study Market DoD/VA Facilities	\$	\$	x	x	x	x	x	x	x
	Total Cost for Market Facilities								

The decision support tool (analytical tool supported by the data repository) can generate total annual system cost for any study market from both a market beneficiary perspective as well as a market facility perspective as illustrated above. In addition, the annual cost of the services provided to beneficiaries is also quantified by product and service line and by unit of workload. The portion of these per unit cost that are variable expenses compared to fixed expenses are also estimated with the detailed cost data that are collected as part of this methodology. These unit cost components of the methodology are illustrated in the table below:

Product and Service Line	Cost per Unit for Care Provided to Study Market Beneficiaries by Study Market DoD Facilities			Cost per Unit for Care Provided to Study Market Beneficiaries by Study Market VA Facilities			Purchased Care Cost per Unit for These Beneficiaries
	Variable Expense	Fixed Expense	Total Expense	Variable Expense	Fixed Expense	Total Expense	Variable Expense
Primary Care	\$/Visit	\$/Visit	\$/Visit	\$/Visit	\$/Visit	\$/Visit	\$/Visit
Specialty O/P Care	\$/Visit	\$/Visit	\$/Visit	\$/Visit	\$/Visit	\$/Visit	\$/Visit
Inpatient Care	\$/Disch \$/Day	\$/Disch \$/Day	\$/Disch \$/Day	\$/Disch \$/Day	\$/Disch \$/Day	\$/Disch \$/Day	\$/Disch \$/Day

With these detailed data on DoD's and VA's current per unit cost of care by type of patient and by type of service, the incremental annual cost impact of potentially

expanding, redistributing, or consolidating certain services among DoD/VA facilities and/or moving service demand from one facility to another to facilitate a greater level sharing can be quantified and compared to the baseline status quo system costs.

Measuring the Cost Impact of Alternatives

Utilizing the annual operating cost data elements as described above, an quantitative analysis for each study market of both the current baseline total annual system costs and the expected incremental impact on cost of implementing any number of alternative sharing opportunities are conducted.

Calculating the Relevant Baseline Costs

To quantify the current baseline costs of providing care to the study market beneficiaries, the relevant cost components for all the care being financed by DoD/VA for any study market can be aggregated and the example current performance cost metrics can be calculated. With the service population and cost data elements that are available in the study database, the current baseline cost performance can be calculated for all services in the aggregate at the total market level, as is illustrated below with example data in the table below.

DoD/VA Joint Assessment Study Market	Total Number of Enrollees in the Study Market	Annual Cost of Care in Market Area DoD/VA Facilities	Annual Cost of Care in Other DoD/VA Facilities	Annual Cost of Care Purchased by DoD/VA	Total Annual Cost of Care Provided to Study Market Beneficiaries	Total Annual Cost per Enrollee
Market "A"	100,000	\$200,000,000	\$50,000,000	\$50,000,000	\$300,000,000	\$3,000

In addition to this ability to calculate the current baseline cost performance for all services in the aggregate at the total market level, the methodology allows the current baseline cost performance to be calculated for specific sub-segments of each study market, such as select geographic submarkets (e.g., a county within the market), select beneficiary populations (e.g., active duty versus other beneficiaries in the DoD or by priority level within the VA), and select product or service lines (e.g., primary care only). This feature of the methodology provides the ability to document a baseline or "status quo" cost performance at either a submarket and/or at a service line level for comparison purposes that is most appropriate to the particular sharing opportunity being assessed.

Calculating the Incremental Operating Cost Impact

To quantify the cost impact of a sharing opportunity, the current baseline costs of the services and facilities that would be impacted by the alternative being evaluated are measured (as described above). An analysis of the incremental impact on future operating costs based upon implementing the alternative is then conducted. The methodology's approach to this incremental cost analysis is based upon the changes in

workloads by facility that are projected to result from the service changes being considered and the per unit variable and fixed cost data that are applicable to these service volumes and facilities.

An illustration of how these cost data are used to measure incremental impact compared to the baseline is presented in Figure xxx below. In this illustration, the incremental annual operating cost impact of an alternative for improving access by moving some primary care volumes from a hospital service setting (Hospital Facility A) to a outpatient service site (Clinic Facility B) is projected.

Hospital Facility A	Current Annual Workloads (a)	Incremental Annual Workload w/Alternative (b)	Current Annual Variable Costs (c)	Current Annual Fixed Costs (d)	Total Current Costs Baseline (c + d)	Incremental Cost of this Alternative (c/a)*b
Primary Care	50,000	-20,000	4,000,000	2,000,000	6,000,000	-1,600,000
O/P Specialty	50,000	0	5,000,000	2,500,000	7,500,000	0
Inpatient Care	2,000	0	8,000,000	6,000,000	14,000,000	0
Total	N/A	N/A	17,000,000	10,500,000	27,500,000	-1,600,000

Clinic Facility B	Current Annual Workloads (a)	Incremental Annual Workload w/Alternative (b)	Current Annual Variable Costs (c)	Current Annual Fixed Costs (d)	Total Current Costs Baseline (c + d)	Incremental Cost of this Alternative (c/a)*b
Primary Care	30,000	+20,000	2,000,000	1,400,000	3,400,000	+1,333,333
O/P Specialty	0	0	0	0	0	0
Inpatient Care	0	0	0	0	0	0
Total	30,000	+20,000	2,000,000	1,400,000	3,400,000	+1,333,333

Facility A + B Combined	Current Annual Workloads	Incremental Annual Workload w/Alternative	Current Annual Variable Costs	Current Annual Fixed Costs	Total Current Costs Baseline	Incremental Cost of this Alternative
Primary Care	80,000	0	6,000,000	3,400,000	9,400,000	-266,667
O/P Specialty	50,000	0	5,000,000	2,500,000	7,500,000	0
Inpatient Care	2,000	0	8,000,000	6,000,000	14,000,000	0
Total	N/A	N/A	19,000,000	11,900,000	30,900,000	-266,667

The analysis of the projected annual operating cost impact of a sharing alternative using this methodology as illustrated above provides a measure of the expected annual

operating cost savings (or cost increases) that would be realized if the DoD and VA implemented the sharing alternative being evaluated.

Incorporating the Transition Costs

In order to evaluate the full future cost impact of an alternative, the methodology combines the future incremental annual operating costs along with the transition costs that are required to implement the alternative (e.g., infrastructure investments required in facilities).

As with the annual operating cost analysis, a baseline future cost of annual expenditures and capital investments that will be required to be made in the DoD and VA's current facilities and infrastructure under a status quo future over the next 5, 10 and 20 years need to be included along with the annual operating costs to more accurately describe the total costs that would need to be incurred to maintain the status quo delivery system into the future in each study market. These future costs are the baseline transition costs that will be required to be invested to maintain status quo operations.

These baseline transition costs are input to the database as part of this methodology and reflect both the estimated added annual expenditures (above current expense levels reflected in the operating cost data) that would be required to sustain existing facilities in their current condition as well as the cost of any planned and/or approved capital investments to renovate or replace existing facilities. Future expenditures that are required to maintain the status quo can be stated in terms of an equivalent annual cost over each facility's lifecycle and added to the baseline annual operating costs to create a measure of the full annual cost required to maintain status quo operations in a study market over the long term.

Once the baseline transition costs have been projected for those facilities that would be impacted by the sharing alternative being evaluated, the incremental transition costs associated with implemented the alternative are estimated. These include any projected capital investment or other one-time expenditures required to implement a defined alternative. In order to evaluate the impact of these transition costs, an annual equivalent cost of these investments over their lifecycle is calculated and added to projected annual operating costs impact of the alternative in order to measure the full incremental cost impact of implementing the alternative compared to the baseline.

In addition to incorporating the cost impact of the investments required to implement a defined alternative, the study methodology also recognizes that the implementation of an alternative could possibly result in an opportunity to avoid some future capital expenditures that are projected in the baseline scenario. In this case, the net impact of the alternative's transition costs would include the added investments required to implement the alternative net of any potential savings on infrastructure investments projected in the baseline future scenario that might be avoided under the alternative scenario.

Impact on Quality of Care

Impact on the quality of care is an important decision criterion, but few quantifiable decision metrics exist. Quantifying quality is a challenging task. Research has shown that higher volumes and lower variation usually result in higher quality output (fewer “rejects”) in many industries. In some specific clinical services, such as open heart surgery and major joint replacements, studies have measured the relationship between volumes and iatrogenic morbidity/mortality and general long term outcomes and reached similar conclusions. The data in this study can be used to identify areas where volumes are low and to measure whether there are opportunities to increase volume—and presumably quality—through sharing of DoD and VA patients. In addition, one could argue that the access criterion also serves as a quality criterion, in that beneficiaries may be more likely to use services that are more convenient which would result in higher volumes.

Other contributors to quality, such as coordination of care, can not be accurately quantified with the data in this study. However, information gathered on site visits can provide valuable insights into assessing opportunities for improvements in these other, less easily quantified, contributors to quality.

Alternatives Evaluation

This section describes how the defined options are evaluated to produce the final recommendations. The Analysis Phase emphasizes factors that are of most critical importance in the delivery of health services to the DoD and VA beneficiaries - specifically access, costs, and service quality. These primary decision criteria (i.e., access, service quality and costs) are consistently applied to the alternative sharing and integration options within a market area during the Assessment Phase.

Recognizing that there are always many factors involved, the methodology also considers other important “second order” decision criteria can also influence decision making.

Examples include:

- Research/teaching mission impact
- Expanding the patient-mix for GME programs
- Environmental impact
- Mobilization/deployment
- Optimal utilization of current capacity
- Limiting the capital investment requirement
- Support of operationally deployed forces
- Outsourcing savings
- Maintenance of wartime readiness within the services of DoD
- Overall TRICARE operations

Where possible, each one of these second order criterion is quantified based on available or estimated data. For criterion where quantifiable measures are not easy to develop, a set of definitions for rating each option are developed. There may be other impacts (e.g.,

department missions, legislation, department policies) that affect the evaluation of the alternatives that are not included in the defined criteria. The alternatives should be evaluated based on these other impacts to develop the final prioritization of the options.

Qualitative: The Collaboration Framework

One of the findings during the research process for this initial application of the methodology indicated that the identification and planning of DoD/VA sharing initiatives have historically been “opportunistic” in nature—i.e., they occurred through an informal surfacing of needs, at a time when local leaders had positive working relationships and were personally ready to explore possibilities. To make substantive progress in the future, a more systematic approach is required; one that can provide a consistent frame of reference on the level of system integration that exists to inform the criteria and performance expectations from market to market.

As part of developing this methodology, Mitretek developed an analytical framework that:

- Channels the opportunities for or enablers of collaboration into a few domains that cover most of the activities observed in a given market or sharing site.
- Clarifies language and definitions applicable to the VA-DoD relationships.
- Identifies the goals and ideals that an organization should seek to achieve when considering collaboration initiatives.
- Can be used to inform a planning framework for the ongoing improvement of collaboration activities.

Brief descriptions of the major elements of this framework are discussed in the following sections.

Domains of Collaboration

One building block is categorizing sharing activities to effectively *define the major domains of collaboration* that may occur among or between organizations within a local or regional market. Collaboration activities and organizational relationships fall within one or more of nine domains: Clinical Workload, Facilities & Equipment, Staffing & HR, Governance & Management, Business Processes, Information Management/Information Technology, Logistics, Education & Training and Research. Each of these domains serves as a potential collaboration enabler, which—if present and performed well—will help to achieve the overriding goal of effective care delivery. If they aren’t handled well, problems and breakdowns are likely to occur. The table below illustrates the influence of each of these domains on collaboration efforts.

Major Categories of Collaboration

Domain	Influence on Collaboration
Clinical Workload	Determines need, demand, and patient flow
Facilities and Equipment	Influences supply/capacity
Staffing & Human Resources	Influences supply/capacity and skills maintenance
Governance and Management	Provides structure and leadership
Business Processes	Organizes work flow
Information Management/ Information Technology	Informs decision making throughout the organization
Logistics	Provides material support, including pharmaceuticals
Education & Training	Fuels development of competent workforce.
Research	Enhances advancement and exchange of knowledge.

Patient Care/Clinical Workload: The examination of this domain highlights the “end game” in undertaking a collaborative endeavor in the interest of patient care. A profile of clinical workload answers the question “What business are we in?” and underscores and the value of having a data repository that is accessible to two or more organizations. Here it is helpful to have access to a side-by-side quantitative profiling of the departments or service lines, which provides a fact-based platform to address collaborative patient care initiatives. The existing or desired degree of collaboration within the domain of patient care will typically vary by inpatient vs. outpatient and certainly by Product Line or Clinical Service Line.

Facilities and Equipment: The domain of facilities and equipment focuses on the geographic distance that exists between two or more facilities. The “availability” (of space and equipment) and the physical and functional condition of affected buildings and departments highlight the need to undertake extensive levels of facility planning. Facility-dominated collaboration is generally considered when the need for a major capital asset is identified. It is expected that the domain of facilities collaboration will continue to be emphasized by both DoD and VA in the future.

Staffing: The domain of staffing and the broad subject of allocating human resources can have a significant impact upon both the needs to collaborate as well as the ability to collaborate – i.e., it can be a *driver* or it can become a *barrier*. The extent to which scarce talents are shared, integrated or otherwise coordinated represents one of the best ways to help deliver patient care and affected support services. This is particularly important when considering the many serious staffing shortages that plague DoD and VA care providers throughout the nation. However, it is important it is to understand some of the key variables within both Systems that impact the access to staff and the capabilities

of staff. For example, the readiness mission of the DoD, and the DoD policy of transfers approximately every two years, have a significant impact on local staffing needs. Additionally, the lack of experience of VA physicians and clinical staff with delivering babies or caring for very sick children is a reality in any discussion of collaborative possibilities. Other dimensions of the staffing challenges are greatly influenced by different pay scales and/or union contracts that may be present.

Business Processes: The domain of collaborating on business and clinical processes addresses the importance of having smooth and efficient handling of clinical, administrative or supporting functions affecting inter-organizational transactions. Processes having both patient care and business process implications should be included. Developing other forms of system integration (e.g., IM/IT), while not integrating business processes, can present a significant barrier to achieving expected efficiencies and cost savings.

Management and Governance: Leadership is a driving force in inspiring and bringing about any hope of success in DoD/VA collaboration. Thus, management and governance issues are of central importance as enablers of effective collaboration. While there is debate about whether management and governance issues should precede or follow the development of collaboration plans, there is no doubt that a concept of rigorous joint planning is needed at all levels of the DoD and VA.

Information Management/Information Technology: The lack of integrated information systems is clearly a major barrier to substantive integration of services. It is also an example of an area in which major investment of capital dollars will be required to address the problem in order to garner the needed support for system integration efforts.

Most authoritative inquiries on the subject of health care services (and every interview that Mitretek conducted in every facility while piloting this methodology), pointed to effective information management and integrated information systems as the single most important enabler to the safe and efficient delivery of care and effective operations of administrative support activities. Achieving this goal, within the context of integrating the services of two separate organizations which have evolved in different ways over many years, clearly requires an evaluation of the opportunities for integrating both hardware and software systems at national, regional, and local levels. The need for easy access to both clinical and business information affects everyone in both Systems: clinicians, executive personnel, employees throughout the organization, and patients. Such accessibility can either “make or break” the success of many collaborative activities.

The integration of information systems has been identified as one of the primary strategic goals of the newly formed VA DoD Joint Strategic Planning initiative. The written strategic plan states the intention to “Enable the efficient sharing of beneficiary data, medical records, and other information through secure and interoperable information management systems.”

Logistics (including pharmacy): There is inherent logic in pursuing collaboration in the area of logistics. Both departments must acquire and manage very similar supplies and equipment in carrying out their patient care duties. Yet there are difficulties in dealing with multiple contracts and vendors, many of which are established nationally. The need

for action is longstanding, and numerous activities are underway nationally to improve procurement and acquisition processes, establish standards for purchasing goods and services, and leverage favorable pricing capabilities.

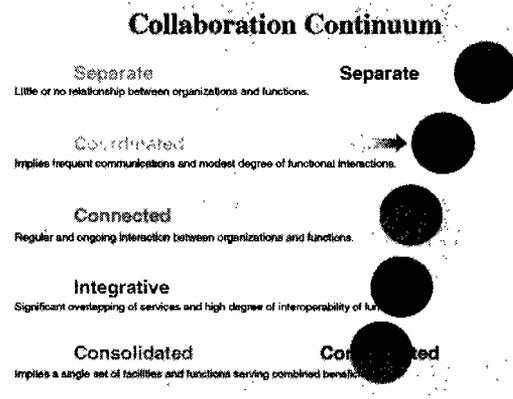

Education: This domain includes both staff education and graduate medical education. There is opportunity for both Systems to improve staff skills while saving expenses if staff training (clinical and other) is coordinated or integrated in some markets. In addition, Graduate Medical Education is a worthy topic for collaboration, despite differences between the two Departments. VA has affiliations with medical schools which are different from the GME mission within the military. However, the military physicians’ need for clinical volumes, which are often present within the VA environment, presents a rich opportunity for collaboration.

Research: Both organizations have strong research agendas, particularly at a national level. However, due primarily to different funding and research protocols, collaboration in research activities is relatively sparse. Many participants involved in the Joint Assessment Study saw collaboration in research activities as an untapped opportunity that could greatly strengthen quality of care outcomes.

Collaboration Continuum

The methodology also addresses matters of terminology. The exhibit below suggests demarcations and definitions for several terms – *separate*, *coordinated*, *connected*, *integrative*, and *consolidated* – that can be useful for the assessment of baseline performance and the feasibility of identified options.

Suggested Definitions for Collaborative Spectrum of Terms

These categories of terminology make up a continuum of degrees of relatedness that can exist among or between organizations in a given market. These are relative definitions only. It should also be clearly noted that “consolidated” is not necessarily the preferred end-state of a given sharing opportunity. This continuum can apply to multiple and differing levels of relationships within any organization or group of organizations. It could apply at an agency level (e.g., Department of Veterans Affairs to Department of Defense) or to facility-to-facility relationships within a local market, or to specific

service-level interactions. The latter may be described as departments, service lines, or a group of functional entities.

Relationship Grid

Current levels of collaboration in a study market are assessed with this methodology in the framework of a relationship grid, which matches the five elements of the collaboration continuum with the nine domains of collaboration. Examples of the descriptive components of this relationship grid are presented as the table below. Application of both this methodology’s data findings and perceptual feedback information from the research and site visits will demonstrate current relationships that exist among and between organizations.

Relationship Grid/Relationship Continuum

	Separate	Coordinated	Connected	Integrative	Consolidated
<i>Clinical Workload</i>	Insignificant referrals	Regular communications	High numbers of referrals	Significant number of referrals as one	Protocol-driven placement of all patients
<i>Facilities</i>	Distant	Some sharing where duplication exists	Projects & facilities come from master planning	Many departments share space	One facility or set of facilities
<i>Staffing</i>	Distinct	Support in peaks and valleys	Joint staff planning	Multiple examples of single/joint staffing	Single staffing
<i>Business Processes</i>	Different	Reduce barriers	Work flows understood & acted on	Transparent	Single system
<i>Management/ Governance</i>	No Relation	Joint planning sessions	Overlap of key functions	Overlap of key functions	One governance & management structure
<i>IM/IT</i>	Separate systems	Evidence of “E” exchange of info	Moving toward systems interface	Complete interoperability	One system
<i>Logistics</i>	Little if any exchange	Borrowing, bartering and contractual exchange	Mutual examination of best pricing and service	Selective joint contracting of major areas of procurement	One supply chain
<i>Education & Training</i>	Distinct	Selective exchange of methods	Frequent use of joint programs and curriculum	Most programs and curriculum are same/similar	Unified program
<i>Research</i>	Distinct	Selective exchange of protocols	Joint planning and review of many studies	Significant overlap of protocols and review	Unified program

While it is necessary to have clarity on the nature and degree of collaboration present within a market, an important question is, “How effective is this collaborative

relationship?” To assess the feasibility of an option, it is essential to gauge why and how the relationships, as they exist currently, will need to change.

Gold Standard/Ideal

Measuring performance at any level within a health care organization (or group of organizations) is difficult, even among health care professionals. As soon as the topic of performance assessment within a health care organization is introduced, numerous secondary questions surface, including: “What measures?” “What standards?” and “What comparisons will be used?”

A useful framework included as part of this methodology is the ideal or "gold standard" for comparison. The table below presents statements of an ideal condition within each domain without regard to the levels of collaboration that exist or don't exist which might best describe the services.

Gold Standard/Ideal

Clinical Workload	Timely, best care placement, and follow-through of patient, based on population-generated demand, regardless of origin
Facilities	Attractive, accessible facilities and equipment sufficient to serve needs of population without duplication
Staffing	Provision of well trained and competent staff appropriate to the demand
Business Processes	Ability to work in ways that are fast and accurate, exhibit smooth handoffs, and please constituents
Management/ Governance	Effective oversight of entire enterprise and ability for timely and effective execution of line and staff activities
IM/IT	Electronic, appropriate, accurate, secure, interoperable
Logistics	Best quality, materials at the right place, right time, and best cost
Education & Training	Perpetual development of highly capable professional, technical and service workforce.
Research	Continual advancement of knowledge that contributes to improved performance and effective outcomes.

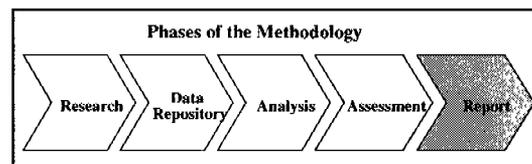

The methodology includes a general assessment of the *contribution of the collaboration* to overall organizational performance—gauged against where the organization could/should be with respect to an ideal state. This component of the Assessment helps determine the degree of collaboration that best fits the needs of the affected facilities or services. This framework can help organizational leaders make informed decisions about the relatedness and organizational models that are best able to serve the beneficiaries within a specific market or sub-market and meet the needs of their organization.

development of discreet business plans. Also, the sorting and grouping of opportunities within the collaboration framework can be assigned to a three levels of action and principle responsibility:

- **Level I (Opportunistic)** sharing opportunities represent activities that mostly focus on logistics, staffing, and business and system processes and/or improvement of sharing activities currently in place. Level I sharing tend to be largely transparent to patients, locally-managed, and easiest to accomplish.
- **Level II (Actionable)** sharing opportunities tend to involve movement of patients, delivery resources, or development of patient care facilities. Level II opportunities imply capital or other types of investment, and some stakeholder resistance—and are thus harder to accomplish.
- **Level III (Transformational)** sharing activities are difficult to achieve and yet have the highest potential impact on cost, quality and/or access to care. Examples of Level III sharing opportunities include: development of interoperable IM/IT systems and common medical records; single governance and management within defined market areas; unified GME and research programs. Additionally, Level III opportunities may involve major policy changes, and/or significant degrees of direction and guidance from national headquarters.

In summary, the methodology of finding and assessing promising opportunities involves multiple approaches and processes. Some of these opportunities can grow out of the analytical investigation; others will emerge through examination of organizational relationships derived principally through interviews. In any event, organizations must engage affected personnel in ordered planning processes so as to fully examine sharing opportunities from many perspectives and levels of analysis.

3.5 Report

The methodology identifies, quantifies, and highlights the most promising sharing and integration opportunities in terms of improving access and service quality and/or reducing costs. The report should document the results of the Study. For ease of readership, the report can be broken into a main report and appendices. It is also useful to develop interim internal reports, such as Market and Sub-market profiles of health care demand and utilization patterns, information on beneficiary populations, summary data related to supply and capacity, and qualitative information regarding potential sharing opportunities.

The main report should include:

- 1.0 Introduction

- 2.0 The Approach and Methodology
- 3.0 Findings and Recommendations from Applying the Methodology to the Study Market Area
- 4.0 Findings and Recommendations from the Research and Field Work
- 5.0 Findings and Recommendations Regarding the Methodology and Continued Analysis and Sharing Opportunities

This report should describe the market area studied from both a demand and supply perspective focusing on the utilization and capacity of the market and the imbalances between them. The results should provide a ranking of identified options based on a set of criteria established for the study.

This page intentionally left blank

4.0 KEY CONSIDERATIONS IN IDENTIFYING MARKETS FOR A JOINT ASSESSMENT STUDY

In the course of implementing the Study methodology, several factors should be considered in estimating the time required to conduct each phase.

Data Request Process

It is important to consider the length of time it may take to request and access pertinent data from specific market sites. Close coordination with market site contacts is essential to obtaining requisite data. Any protracted period of time it may take to obtain data needs to be communicated with the study sponsors, as soon as possible, to secure leadership support, as necessary, when securing needed data from sites.

Qualitative Information

On First Pass site visits, the study team may spend additional time soliciting qualitative information from those at the site. During visits, facility leaders and staff typically have the opportunity to discuss their ideas for sharing and collaboration. This provides rich feedback from which to assess a current state of operations. The MTS team also found that establishing a common agreement among facility leaders and staff about what collaborate, share or integrate means aids in achieving consensus and clarity about the current environment in which a market site operates.

Extracting Data

The study team is responsible for extracting data from the data repository and analyzes different aspects of the markets at the same time. To successfully conduct this phase, the MTS team created a Decision Support Tool based on data extracted from an Oracle database (and dropped into Pivot Tables in MS Excel). During development, the MTS project team realized that this tool had enormous potential to assist the health care planners on-site and may be a useful tool to use in future studies.

Site Leaders and Stakeholders

During the MTS study, the team received feedback from site leaders that they were not yet ready to have recommendations presented and analyzed regarding sharing opportunities specific to their market site. Site leaders emphasized that they are looking for national guidance from agency leadership, along with supporting data in order to make well-informed decisions regarding changes. Enlisting the support from agency leadership in working with site leaders and stakeholders is an important key consideration in successfully reviewing and presenting recommendations to market sites.

Listed below are some additional considerations that can be applied in determining the priority and/or appropriateness of a specific market area for the application of this study methodology:

1. General

- Leadership/Stakeholder Involvement – What is the degree of “readiness” on the part of the local/market area senior leadership within both the DoD and VA to actively participate and contribute to the study?
 - Prototypical Market – While all VISN markets and DoD catchment areas exhibit certain unique characteristics, the earliest study sites should represent as “typical” a market as possible in order to replicate the study on a national basis.
 - Previous Studies – Has this market already been subject to DoD/VA joint venture studies, VA CARES analysis or any other previous market evaluation?
2. Proximity
- Distance – What is the driving distance between the Federal facilities in the market? If these facilities are more than an hour’s drive apart, do they tend to serve the same geographic market?
 - Types of Facilities – Does the market contain a mix of inpatient and ambulatory facilities (Federal and Non-Federal) in close proximity?
 - Proximity to Other Markets – Is the proposed market adjacent to or close by another Federal facility’s catchment or market area? Is there significant overlap in these market areas? (Are patients routinely referred from one market to another for specialty services?)
3. Market Size/Geography
- Size of Beneficiary Population – Is the proposed market of sufficient size to realize economies of scale in co-locating, consolidating or providing joint services between the DoD and VA?
 - Geographic Boundaries – Are there natural boundaries (e.g., lakes, rivers, mountains) that impact the access to care and determine patient migration patterns?
 - Medical Center – Is at least one of the Federal facilities in the market an academic medical center?
 - Type of Market – Is the proposed market mostly urban, suburban or rural in nature? Is it a mixture of market types?
 - Capacity – Does the market exhibit over-/under-capacity issues, including Non-Federal facilities (e.g., high growth markets tend to have under capacity; declining markets tend to have an over capacity of inpatient-related beds and services)?
4. Demographics
- Mix of Beneficiaries – Does the proposed market contain sufficient numbers of military retirees, family members and others, including those who are “dual eligible” for care in both the DoD and VA?
 - Average Age of Beneficiaries – Does this market include significant eligible beneficiaries who are over the age of 65 (or who will be within a few years)?
5. Capital Investment Requirements
- Facility Life Cycle – Do the facilities currently in the market represent newer or older inventory within the DoD and VA?
 - Capital Investments – Are any of the Federal facilities in the proposed market currently in line for major facility investments for additions/alterations or replacement?
 - Relative Costs – Is this market fairly typical of overall capital cost requirements, or are there unique issues in construction and related costs?

Attachment 4: Capacity Conversion Factors

This is a list of "Capacity Conversion Factors" that might be used to translate supply into capacity. These are high level planning factors for "first pass analysis" to determine whether excess or under capacity might exist. These should not be considered benchmarks for operations/productivity. Note that the FTE standard in the physician clinics are based on a physician who spends 100% of time in clinic (i.e. visits per hour x 168 hours per month)

This is a compilation of factors found from commercial, DoD and VA sources. All of these factors should be evaluated, researched, and confirmed by the DoD and VA before use. Commercial factor is usually MTS experience unless otherwise noted. Min and Max are suggested bounds--they are not researched figures.

Dept. Type	Department Name	Factor Type	Factor Name	Translation Factor Descriptions	Commercial Factor	DoD Factor	VA Factor	Min	Max	Comments
Clinic	Dental Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	2157	260 DWV				MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. DoD: DWV is like an RVU and based on billable amounts. There is no simple "visits per provider." Also, DWV is different for general and specialists.
Clinic	Family Practice Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	4746	3312, 3646	3300	3000	6529	MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. Sources: VA CARES 1 (VISN 12) Study in 2000 BA&H target; DOD: TriCare MHS Standard Metric Set Mar 2002 ~13.3 RVU Adj visit per 8 hr day, assume 45 week year per MHS optimization study (use 51 weeks for FTE in our study). Note that an AMEDD document http://www.tricare-osd.mil/ocms/download/2002Innovations/8_suggests_5646_visits_per_FTE_and_Levy_RA_MHS_Optimization_and_Recapturing_Workload_from_Campus_CNA_2002 says 4745. Commercial is MGMA mean for primary care. 90th percentile is 6529. AAFP states avg of 90.7 visits per week x 51 weeks = 4626. Providers: MD, NP (.5 MD equivalent) and PA (.5 MD equivalent)
Clinic	Cardiology Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	5000					See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Dermatology Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	6572					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. This is a blend of invasive/non-invasive. See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Endocrinology Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	3553					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Gastroenterology Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	4294					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Hematology Oncology	Capacity	FTE Std	annual visits per 100% in clinic FTE	4800					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Geriatrics Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	4037					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Internal Medicine Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	4111					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Nephrology Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	4082					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors

Dept. Type	Department Name	Factor Type	Factor Name	Translation Factor Descriptions	Commercial Factor	DoD Factor	VA Factor	Min	Max	Comments
Clinic	General Surgery Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	3501					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Cardio/Thoracic Surge	Capacity	FTE Std	annual visits per 100% in clinic FTE	1632					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Gynecology Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	6525					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. (For GYN only-- not OB/GYN). See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Ophthalmology Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	6548					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Orthopedic Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	6249					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. (General Ortho). See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Plastic Surgery Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	3702					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Urology Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	5893					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Vascular Surgery Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	2540					MGMA median visits per provider, converted into 100% in clinic at 168 hours per month. See attachment "Development of Visit/Hour Benchmarks by Specialty" for suggestions for DoD & VA factors
Clinic	Mental Health Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	2650			1575	2650	Sources: Commercial: MGMA General Psychiatry. 168 hours per month x hourly visits. VA CARES 1 (VISN 12) Study in 2000, Mental Health. Combo of MD, psychologists and social workers 15 minute units; FTE is 2016 hours and 75% clinical; = 6046 15 min units per PT or OT FTE per year Source: Dentecomm (for general dentists)
Clinic	PT OT Clinic	Capacity	FTE Std	annual visits per 100% in clinic FTE	6046

Estimating Capacity/Workload Volumes from DoD N/A data

These are Demand Conversion Factors used to convert claims level ancillary volume into encounter-level workload. Ancillaries occur in both the inpatient and outpatient setting, and at the claims level, are counted at too granular a level for measurement against capacity. If future studies wish to analyze ancillaries, it is necessary to convert ancillaries into encounter level workload prior to comparing against capacity. DoD/N/A should consider these a draft and a starting point for ancillary planning.

		Data Source
		DoD VA PTF
1. Surgical Cases		
a. Inpatient	Count IP events with surgical DRGs, should be 1 DRG per event Surgical DRGs attached.	SIDR PTF HCSR(I)
b. Outpatient	Count OP visits to the the following WUs (Count duplicates of Facility-SSN-Date-WU as 1 visit) (Count 327 and 328 with same Facility-SSN-Date as 1 visit)	SADR OPC HCSR(NI)
	DoD _____ VA <u>328</u>	
	DGA _____ VA <u>327</u>	
2. Cardiac Cath/EP		
a. Inpatient	Count IP events (discharges) with cath DRGs, should be 1 DRG per event Cath DRGs =see tab E of Cath DRG's	SADR OPC HCSR(NI)
b. Outpatient	Count OP visits to the the following WUs (Count duplicates of Facility-SSN-Date-WU as 1 visit)	SADR OPC HCSR(NI)
	DoD _____ VA <u>333</u>	
DDE _____		
3. Radiation Therapy-Treatment		
a. Outpatient & inpatient	Count OP visits to the the following WUs (Count dups of Facility-SSN-Date-WU as 1 visit)	SADR OPC HCSR(NI)
	DoD _____ VA <u>144</u>	
	BAS _____ VA <u>149</u>	
5. Imaging		
a. inpatient	Count IP events (discharges) containing at least one of the ICD9 procedure codes:	SIDR PTF HCSR (I)
b. Outpatient	Count OP visits containing at least one of the CPT codes in Tab D	SADR OPC HCSR(NI)
To determine levels of inpatient care, use the following:		
1. IP Critical Care	Count the IP events (discharges) and BDOC in the following WUs	SIDR PTF HCSR(I)
	DoD _____ VA <u>12</u>	
	AAH _____ VA <u>63</u>	
	ABC _____	
2. IP Tertiary Care	Count the IP events (discharges) and BDOC for events with DRGs with a caseweight >= 2.0, from the list on attached document	SIDR PTF HCSR (I)

DoD/VA Joint Assessment Study
Site Data Survey Instrument

Thank you very much for your assistance with this Study. In addition to volume and cost data we have obtained via national databases, we are seeking "local" data to inform our analysis.

Please provide the following information in as simple a way as possible for you. Standard reports and outputs are sufficient; please do not spend a lot of time creating unique reports for us. For example, if we ask for annual volume, but you have a routine report that has monthly volume, provide us the monthly report and note the time period. Not all requests will be applicable to your site. Please provide the information in electronic format such as MS Excel, Word, CAD, etc. If you do not have data electronically, please provide a hard copy.

Please send or e-mail the information by DATE, to:

PERSON
Mitretek Systems Inc.
3150 Fairview Park Drive South
Falls Church, VA 22042-4519
PERSON@mitretek.org

If you have any questions about this request, please call Kathleen Gallagher at 703-610-1930

Table with 2 columns: POC for Data and General Site Information. Includes sub-sections for Facility and Capacity and Workload.

DoD/VA Joint Assessment Study

POC for Data

Other

Please describe briefly the current or planned activities for your organization in the following areas, with particular references to joint sharing between the DoD and the VA:

- 1) Telehealth
- 2) Computerized Patient Records
- 3) Provider Credentialing
- 4) Surgical Quality Assessment
- 5) Rehab Services
- 6) Administrative Services
- 7) Clinical Centers of Excellence
- 8) Pharmacy
- 9) Billing

DoD/VA Joint Assessment Study

Capacity and Workload

Note: add extra lines in table to fill in data in appropriate areas

1. Inpatient Beds.
 - Avail Beds - Bed space constructed for delivery of inpatient care and the space meets the standards applied by common hospital accreditation bodies. It does not include transient patient beds, bassinets, and incubators. Beds are not necessarily set up but could be configured without renovation costs
 - Staffed Beds- Bed space constructed for delivery of inpatient care and the space meets the standards applied by common hospital accreditation bodies. It does not include transient patient beds, bassinets, incubators. Beds are set up and staffed
 - Avg Occupancy Rate (optional data from site) – based on staffed beds

Grouping	Description	Unit Type	Floor/ Area	Available Bed	Staffed Beds	Avg Occ Rate
Critical Care IP	All ICU s including Pedi; excluding NICU					
Psychiatry IP						
Rehabilitation IP	All rehabilitation except blind rehab, PR RTP, and SCI if in separate spaces					
Obstetrics	List either LDR and Post-partum OR LDRP					
Medical Surgical IP	All inpatients Including telemetry, family practice, pediatrics, dental, gyn; excluding Critical Care, Psyche, OB and Rehab					
Other specialty Units	Blind Rehabilitation, PR RTP, SCI					

2. Operating Rooms- All OR s Inpatient and Outpatient regardless of specialty; separate out C-Section rooms (OB OR); excludes cysto and endo which are included under procedure rooms elsewhere. Please indicate If Ambulatory ORs are in a separate location, otherwise indicate total only. Please provide Volumes for FY 02 for Surgery.

EXAMPLE - FYI ONLY

Capacity and Workload

Note: add extra lines in table to fill in data in appropriate areas

1. Inpatient Beds.
 - Avail Beds - Bed space constructed for delivery of inpatient care and the space meets the standards applied by common hospital accreditation bodies. It does not include transient patient beds, bassinets, and incubators. Beds are not necessarily set up but could be configured without renovation costs
 - Staffed Beds- Bed space constructed for delivery of inpatient care and the space meets the standards applied by common hospital accreditation bodies. It does not include transient patient beds, bassinets, incubators. Beds are set up and staffed
 - Avg Occupancy Rate (optional data from site) – based on staffed beds

Grouping	Description	Unit Type	Floor/ Area	Available Bed	Staffed Beds	Avg Occ Rate
Critical Care IP	All ICUs including Pedi; excluding NICU	Surgical ICU	4 North	10	8	80
Critical Care IP		Coronary Care	3 North	8	8	60
Critical Care IP		Med/Pedi ICU	2 North	10	10	70

Technical Documentation for Decision Support Tool

Attachment 7 to Appendix B - Study Methodology

Overview of this Attachment

The decision support tool was developed to assist the analysis of data from the DoD and the VA in a common format. The tool brings together data from several DoD and VA data sources into a common database in order to facilitate the development of queries and summary results.

Subsections:**1. Datasets**

- 1.1. DoD Datasets
- 1.2. VA Datasets

2. Global Pivot Table Fields

- 2.1. Age Cohort
- 2.2. Beneficiary Group
- 2.3. System
- 2.4. Market
- 2.5. FacMarket
- 2.6. Provider Market

3. Pivot Table Output Series

- 3.1. Series 1. Eligible
- 3.2. Series 2. Enrollees
- 3.3. Series 3. Users
- 3.4. Series 4. Direct Care Services
- 3.5. Series 5. Indirect Care Services (and Costs)
- 3.6. Series 6. Staffing
- 3.7. Series 7. DoD Direct Care Costs

4. Data Specifications

- 4.1. DoD Datasets
- 4.2. VA Datasets

5. Market Facility IDs and Beneficiary ZIP Codes

1. Datasets

The following two tables outline the datasets collected from the DoD and VA. Typically each dataset represented one year's worth of data. Where applicable, the set has been identified as either Direct or Indirect based on the type of care the dataset represents. Direct care is defined as care received from a DoD or VA facility. Indirect care is defined as care received from a facility that is not operated by the DoD or VA. The specific fields and parameters of the datasets are outlined in Section 5.

1.1 DOD Datasets

Data Source	End Date	Record Count	Cost Class
HCSRI	9/30/2000	40311	Indirect
HCSRI	9/30/2002	32159	Indirect
HCSRNI	9/30/2000	5232676	Indirect
HCSRNI	9/30/2002	4133184	Indirect
LENR	4/30/2002	1390770	-
MCFAS	9/30/2002	1121937	-
MEPRS	9/30/2002	28344	-
MEPRS	9/30/2000	59884	-
PITE	9/30/2000	762787	-
PITE	10/31/2001	700418	-
PITE	12/31/2001	777702	-
PITE	2/28/2002	777213	-
PITE	9/30/2002	765038	-
PITE	8/31/2002	768812	-
PITE	7/31/2002	771696	-
PITE	6/30/2002	770725	-
PITE	5/31/2002	769809	-
PITE	4/30/2002	771664	-
PITE	3/31/2002	773242	-
PITE	1/31/2002	779203	-
PITE	11/30/2001	773911	-
SADR	9/30/2000	7381798	Direct
SADR	9/30/2002	3892319	Direct
SIDR	9/30/2000	86003	Direct
SIDR	9/30/2002	43402	Direct
WWR	9/30/2000	302537	-
WWR	9/30/2002	153316	-

1.2 VA Datasets

The following table lists the datasets received from the VA data sources. The Dual User datasets were generated by the VA based a special query.

Data Source	End Date	Record Count	Cost Class
Inpatient Fee	9/30/2000	4593	Indirect
Inpatient Fee	9/30/2002	5867	Indirect
OPC Events	9/30/2000	1947688	Direct

OPC Events	9/30/2002	1979355	Direct
OPC Visits	9/30/2000	1224044	Direct
OPC Visits	9/30/2002	1373357	Direct
Outpatient Fee	9/30/2000	157729	Indirect
Outpatient Fee	9/30/2002	192965	Indirect
PTF Main	9/30/2000	16600	Direct
PTF Main	9/30/2002	15819	Direct
PTF Procedures	9/30/2000	24668	Direct
PTF Procedures	9/30/2002	22378	Direct
PTF Surgery	9/30/2000	3669	Direct
PTF Surgery	9/30/2002	3217	Direct
PTF XM	9/30/2000	2481	Direct
PTF XM	9/30/2002	1904	Direct
VA Enrollment	9/30/2002	211145	-
VETPOP	9/30/2002	155445	-
Dual User	9/30/2000	1396543	-
Dual User	9/30/2002	1396543	-

2. General Pivot Table Information

Many of the fields used the pivot tables appear in several of the pivot tables. The following section defines global fields.

2.1 Global Fields

2.1.1 Age Cohort (called age_range)

Ages were grouped in the following brackets:

- 0-17
- 18-44
- 45-64
- 65+

2.1.2 Beneficiary Group (called bcp_g_common)

Beneficiary Category for DoD and Priority Group for VA

VA Priority Group Mappings

Priority Group	Beneficiary Group
1, 1a	1
2	2
3	3
4	4
5	5
6	6
7a	7
7c	8

DOD Beneficiary Categories

BENCAT	Beneficiary Group
4,ACD, GRD, A11,A12,A13,A14,A15,A22,A23,C11,C12,F11,F12, F14,F15,F22,F23,M11,M12,M13,M22,N11,N12,N13,N14,N22,P11,R74	AD
1,A41,A45,C41,C45,C48,F41,F45,F48,M41,M45,N41,N45,N48,P41	ADFM
2,RET,A31,A32,A33,B31,C31,C32,F31,F32,F33,M31,M33,N31,N32,N33, P31,P32,P33	RET
K61	VET
RETFM,3,DR,DS,A43,A47,C43,C47,F43,F47,M43,M47,M48,N43,N47, P43	RETFM
OTH,A21,A24,A25,A26,A27,A28,A29,C22,C29,F21,F25,F27,F28,F29, K53,K57,K62,K64,K65,K68,K69,K71,K72,K73,K74,K75,K79,K82,K83, K84, K91,K92,K99,M25,M27,M29,M32,N25,N27,N28,N29,R72,R73,R75,999	OTHER

2.1.3 System

System represents the branch the respective data is from either DoD or VA.

2.1.4 Market (including In-Migration)

The Market field defines the origin of the users of the system. A user can be either from the given market or defined as 'In-Migration' which means he/she is from an area outside the given market. See Figure C.1 below. There is also a corresponding field called Submarket which further refines the Market.

2.1.5 Facmarket (including Out-Migration)

The Facility Market field defines the location of the treating facility. A facility can be either in the given market or defined as 'Out-Migration' which means the facility is outside the given market. See Figure C.1 below. There is also a corresponding field called Facsubmarket which further refines the Facmarket.

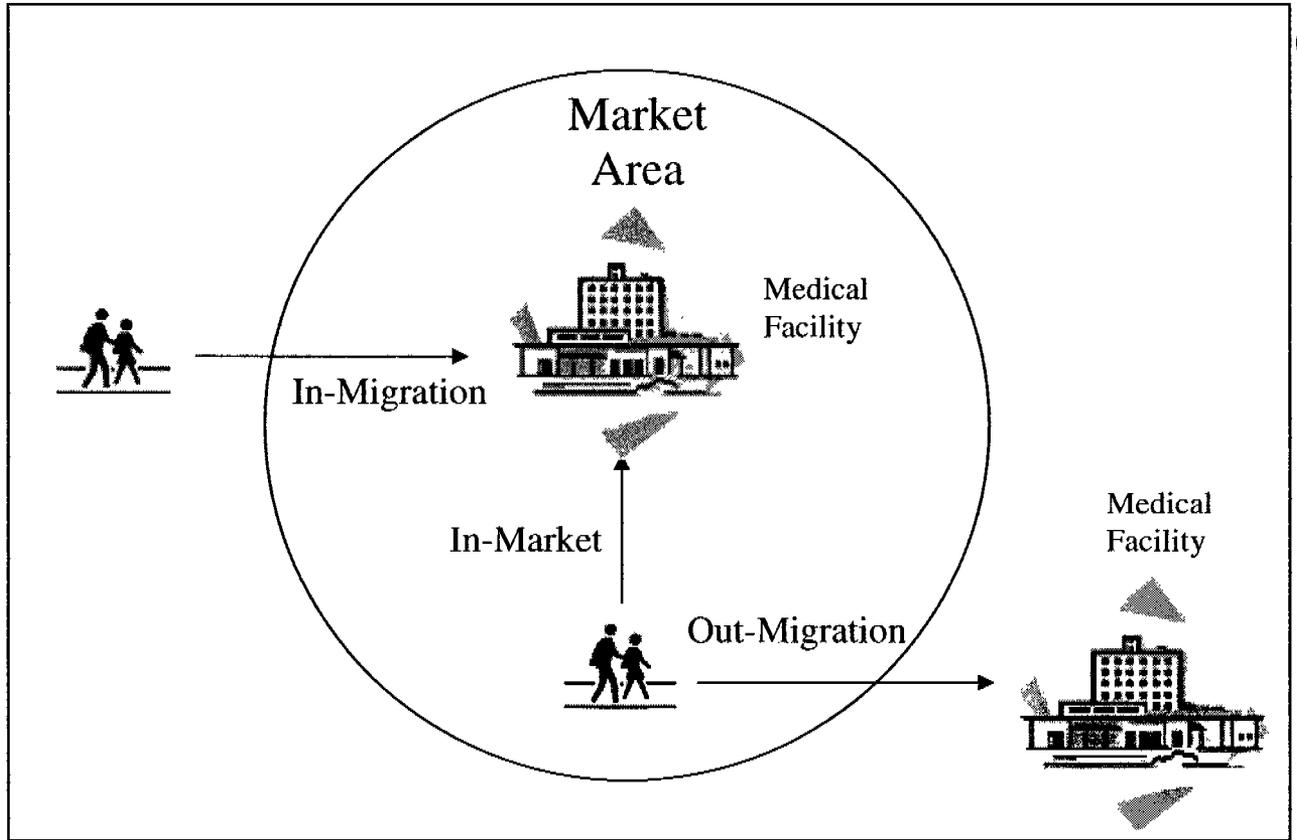

Figure C.1 - Market Definition Diagram

2.1.6 Provider Market (for Indirect Care)

The provider market field defines the location of the provider giving care in the indirect care subsystem. This field is analogous to the Facmarket.

3. Specific Pivot Table Information

3.1 Series 1 – Eligibles

This series describes the eligible population. The data is grouped by location, gender, age cohort, beneficiary group, gender, origin, and corresponding market information. The query & fields used to produce these results are described below.

Assumptions:

PITE data from September 2000 and 2002 was used as a sample for determining the eligibles for DOD.

Filters: None

Pivot Table Fields and Definitions:

Pivot Table Field	Database Field	Transformation	Column Mappings		System
			Original Dataset	Original Field Name	
COUNTY	marketarea.county	Mapped ZIP code or fips to associated county	PITE VetPop	RES_LOC_PR_ZIP_CD FIPS	DoD VA

from tmp_va_population population, marketarea  
where (sample_date = to_date('09/30/2000', 'mm/dd/yyyy') or sample_date =  
to_date('09/30/2002', 'mm/dd/yyyy'))  
and population.fips = marketarea.fips  
group by to_char(population.sample_date, 'YYYY'),  
recode_agegrp(population.age_group),  
marketarea.market,  
marketarea.county,  
population.gender,  
population.fips,  
marketarea.state,  
marketarea.submarket;  
  
commit;  
  
end;
```

3.2 Series 2 - Enrollees

This series describes the enrolled population. The data is grouped by location, gender, age cohort, beneficiary group, gender, facility service area, and corresponding market information. The query & fields used to produce these results are described below.

Assumptions:

Only September 2000 and 2002 records from the LENR dataset was used. Since LENR does not maintain a ZIP code for the sponsor, a ZIP code was derived by matching the sponsor ssn to the corresponding monthly PITE dataset.

Filters: September 2000 and 2002 data for DoD. And FY02 data only for VA.

3.3 Series 3 – Market Users and Facility Users

This series quantifies the market users and facility users for the DoD and VA. The data is grouped by location, gender, age cohort, beneficiary group, gender, origin, treating facility, and corresponding market information. The query & fields used to produce these results are described below.

Assumptions:

The Origin field listed below is used to select either the Market are Facility Users data. One of these values must be selected in order for the results to be valid. The Subsystem field is used to select either the Direct or Indirect results of the Market Users dataset. A value of Both indicates users that use both systems. The System field as an extra value of 'Dual Users' which is used to select the subset of users who use both the DoD and VA facilities.

Filters:

Telephone consults are excluded from the DOD data. Duplicate daily services for a patient are excluded from the VA data.

3.4 Series 4 – Direct Care Services

This series provides a summary of services provided by both the DoD & VA facilities. The data is grouped by facility, branch, product and service line, and corresponding market information. The query & fields used to produce these results are described below.

Assumptions:

The Volume field indicates either the number of discharges for inpatient care or the number of visits for outpatient care.

Filters:

Telephone consults are excluded from the DOD data. Duplicate daily services for a patient are excluded from the VA data.

3.5 Series 5 – Indirect Care Services and Costs

This series provides a summary of the indirect care and associated costs for the users in the market.

Assumptions:

In order to generate data for VA, ZIP code, gender, and DOB data was derived by retrieving the associated fields in the OPC Event file based on the patient ssn.

Filters: Only Contract Hospital visits where extracted from the VA datasets. For the DoD datasets, inpatient claims were excluded from the outpatient dataset (HCSR-NI) and only the primary procedure was counted in the results.

Series 7 – DOD Direct Care Costs

This series provides direct care cost information for the SIDR and SADR datasets. The data is grouped by facility, fiscal year, and corresponding market information. The price, *fullcost* and *vcost* are the key items in this dataset. The query and fields used to produce these results are described below.

Assumptions:

Filters: Telephone consults are excluded from the data

Pivot Table Fields and Definitions

Pivot Table Field	Database Field	Transformation	Visit Type	Column Mappings		System

4. Data Request Specifications

The following tables outline the definitions of the datasets and fields that were requested from the DoD and VA to facilitate this analysis. Each dataset identifies the timeframe and major filters applied before the data was extracted. The field names and data types are also listed.

4.1 DoD Datasets

SIDR (DoD)

Timeframe of Data:	Disposition Date in FY 2000, 2002
Format:	Delimited (!) format, variable length
	Read data fields in the order stated below
Filters:	Patient residence ZIP code in reference list;
	OR catchment area ID Code in reference list;
	OR PRISM Area ID Code in reference list;
	OR Treatment MTF in reference list

Field	Type	SAS Name
2 nd Clinical Service	\$4	CLN2
3 rd Clinical Service	\$4	CLN3
Admission Date	YYYYMMDD	ADMDATE
Admission Source	\$1	ADM SRC
Admitting Clinical Service	\$4	CLNADM
Age at Disposition		RECAE
Baseline Relative Weighted Product	7.4	BASERWP
Bed Days 2 nd Clinical Service		CLN2DAYS
Bed Days 3 rd Clinical Service		CLN3DAYS
Bed Days Admitting Service		CLN1DAYS
Bed Days Civilian Hospital		BEDCIV
Bed Days Dispositioning Service		CLN4DAYS
Bed Days in ICU		ICUDAYS
Bed Days Other Federal Facilities		BEDOTHER
Bed Days, excl Bassinet Days		BDAYS1
Common Beneficiary Category	\$1	COMBENF
Patient Category Code	\$3	BENFCATI
Relative Weighted Product	8.4	TOTRWP
Catchment Area ID	\$4	CATCH
DEERS Alternate Care Value	\$1	ACV
DEERS Enrollment DMISID	\$4	DEERSEN
Diagnosis Related Group	\$3	DRG
Disposition Date (SAS Date)	yyyymmdd	DISPDATE
Disposition Type	\$2	DISPTYPE
Dispositioning Clinical Service	\$4	CLNDISP
DMIS Patient Age Group	\$1	DMISAGE
DMIS Patient Sex (F/M)	\$1	DMISSEX
Price		PRICE
Ethnic Classification	\$1	ETHNIC
Family Member Prefix	\$2	FMP

APPENDIX B

Attachment 7

Full Cost		FULLCOST
Initial Admission Date	yyyymmdd	INITADM
<i>Jth</i> ICD9 Diagnosis Code	\$5	DXJ
<i>Jth</i> ICD9 Procedure Code	\$4	PROCJ
Major Diagnostic Category	\$2	MDC
Marital Status	\$1	MARITAL
Medical/Surgical Indicator	\$1	MSFLAG
